PRESENTING CLINICAL SIGNS

History: History of coughing for the past 2 years. Has been treated and resolved. Persistent cough in the past 6 months with no resolution. Chest radiographs reveal fluid around the lungs. No heart murmur noted. ProBNP normal along with Chem/CBC.

-Current medications: Furosemide 40mg BID. Gave furosemide injection today. A thoracentesis procedure done to drain 200ml of fluid from chest cavity.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild diffuse thickening of mitral valve leaflets with no prolapse into the left atrial lumen. No mitral regurgitation with no left atrial dilation. Normal LV diameter with adequate myocardial function. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial noted. Pockets of pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac dimensions and function, with no obvious dysfunction or dilation of the left heart. No significant valvular leaks are visualized, and no evidence of pulmonary hypertension.

These findings would suggest pleural effusion is noncardiac in origin. Consider advanced imaging of the chest, such as a focused thoracic ultrasound (to screen for pulmonary or mediastinal
