PRESENTING CLINICAL SIGNS

Grade 1-2/6 left-sided murmur. Asymptomatic.

ECHOCARDIOGRAPHIC FINDINGS

2D, M-mode, and Doppler study.

Left atrial size is normal. The mitral valve leaflets are mildly thickened and exhibit systolic prolapse. There is Doppler evidence of mitral regurgitation present. Left ventricular dimensions are normal. Left ventricular systolic function is hyperdynamic. The aorta and aortic valve are normal. Right atrial and right ventricular dimensions are normal. The tricuspid valve appears normal, though trace tricuspid regurgitation is present. The pulmonary artery and pulmonic valve appear normal. No shunting lesions are visualized. No pericardial effusion or cardiac masses are seen.

LA – 25.7 mm
LVIDd – 25.7 mm
LVIDs – 14.0 mm
FS – 45.5%
LVOT – 0.70 m/s
RVOT – 0.74 m/s

ASSESSMENT/RECOMMENDATIONS

Degenerative mitral valve disease – stage B1

This examination demonstrates regurgitation of blood across JJ's mitral valve resulting from degenerative valve disease. The hemodynamic effects of the regurgitation appear to be mild, as JJ does not have secondary dilation of either of his left heart chambers, and his left ventricular systolic function is well-preserved. As such, JJ's current risk for the development of clinical signs secondary to his mitral valve disease, such as coughing, exercise intolerance, syncope, and labored breathing, appears to be low.

No therapy is recommended at this stage of disease.

A recheck echocardiogram is recommended in 6 months to monitor for disease progression.
