

PATIENT

Turtle Whittington

PRESENTING CLINICAL SIGNS

History: Grade 2-3/6 heart murmur. History of heartworm disease (treated in 2021 with immiticide protocol, cleared Nov 2021 and has remained negative).

SPECIES

Canine

RADIOGRAPHIC FINDINGS *NOTE: Images submitted for supplemental cardiac information only. Normal cardiac silhouette. No obvious evidence of CHF.

BREED

Heeler Mix

ELECTROCARDIOGRAPHIC FINDINGS *Note: Single lead ECGs are evaluated as a rhythm strip. Morphology/MEA cannot be definitively commented on.

A single lead ECG is available; 25mm/s, 10mm/mV. The average heart rate is 90bpm (range 62-125bpm). The P wave is variable in appearance and location, most consistent with a wandering pacemaker; however, a six-lead tracing may be beneficial to confirm. The QRS morphology is positive. No ectopic beats, pauses or other dysrhythmias observed.

ECG diagnosis: Suspect profound respiratory sinus arrhythmia with a wandering pacemaker.

SEX

Male Neutered

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild diffuse thickening of mitral valve leaflets with no prolapse into the left atrial lumen. Mild eccentric mitral regurgitation with no left atrial dilation. Normal MR velocity. Normal LV diameter with adequate myocardial function. The tricuspid valve appears mildly thickened with mild tricuspid regurgitation. TR velocity consistent with early pulmonary hypertension. Mild right heart/MPA enlargement. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic and trace pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

AGE

5 years

WEIGHT

47lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Chronic degenerative valve disease causing mild mitral and tricuspid regurgitation. Lack of significant left atrial enlargement indicates the current risk for complication is low. Mild pulmonary hypertension is noted with mild right heart enlargement. This is likely secondary to prior heartworm infestation. No additional issues such are noted in this study.

Given these findings, no cardiac medications are clearly indicated. Pulmonary hypertension may or may not progress as this patient ages. Monitor for any development of respiratory signs or specifically exertional syncope/dyspnea. Reassessment of chest radiographs and pulmonary pressures is recommended in this instance.

The ECG is most consistent with a respiratory sinus arrhythmia and a wandering pacemaker. This implies that the P wave appearance is variable. This is most consistent with high vagal tone; however, response to light exercise or stress would be reasonable to confirm.

Assessment of progression in the future will help predict long term prognosis, which is highly variable at this stage (B1). Omega fatty acid supplementation and mild salt restriction may be of some long-term benefit. Monitor for development of a cough, labored breathing, exercise intolerance or collapse episodes.

Anesthetic risk is considered mild if needed. Cardiac protective drug choices (opioid/benzodiazepine premedication, propofol or alfaxalone induction, isoflurane gas) are recommended. **Pre-oxygenate for 5-10 minutes prior to induction.** Premedicate with a vagolytic. Monitor for arrhythmias, hypotension, and hypoxia both intra and post-operatively and intervene as necessary. Mild IV fluid restriction is recommended to avoid fluid overload.

Recommend conservative monitoring with a recheck echocardiogram in 6 months, sooner if any development of clinical signs.
