PRESENTING CLINICAL SIGNS

History: Presented for routine spay. Abnormal EKG readings noted. Anesthesia discontinued and EKG screening performed.
-ECG (Idexx): Marked RAD, NSR.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Normal mitral valve leaflets with no prolapse into the left atrial lumen. No obvious mitral regurgitation with a normal left atrial dimension. Normal LV diameter with adequate myocardial function. The tricuspid valve appears normal with trivial tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac dimensions and function, with no obvious dysfunction or dilation of the left heart. No significant valvular leaks are visualized, and no evidence of pulmonary hypertension. No obvious congenital shunts or defects are observed.

These findings do not explain a right axis shift on the reported ECG. While this may be a normal variant, follow up and further evaluation should be dictated by the ECG report.

**PATIENT**

Josie Rigs

From a structural standpoint, no obvious contraindication for general anesthesia is appreciated. Consider baseline CXR to screen for extra-cardiac issues that may be present.

SPECIES

Canine

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or collapse episodes.

BREED

Maltese Mix

A recheck echocardiogram is recommended should a significant murmur develop or signs of cardiac compromise be noted in the future.
