ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

Full urinary bladder with a normal thickness and appearance of the wall. Small amount of floating hyperechogenic sediment. No uroliths evident.

Normal trigone area, proximal urethra, and iliac blood vessels.

Iliac lymph nodes and ureters not visualized.

Normal renal size (left 6.6 cm, right 6.8 cm) with increased echogenic appearance, some loss of cortico-medullary differentiation, and normal capsule and blood flow. Normal right pelvis, mild left pyelectasia (0.26 cm). Focal cortical cyst in the cranial pole of the right kidney. Bilateral pinpoint cortical mineralization.

Reproductive System

Small prostate (0.95 cm) with an increased echogenic appearance.

ULTRASONOGRAPHIC FINDINGS

- Urinary bladder sediment.
- Age-related renal changes.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Etiologies for the urinary bladder sediment would be cystitis, hemorrhage or crystalluria.

The appearance of the kidneys on this ultrasound is similar to that evident on the previous one.

The appearance of the prostate can be considered incidental.

The masses that were evident on the previous ultrasound have resolved, making them most likely inflammatory polyps or secondary to polyploid cystitis.

Further assessment would be urinalysis and possibly urine culture.

Specific therapy would be dependent on an etiological diagnosis.
