## PRESENTING CLINICAL SIGNS

History: Recheck echo. No symptoms. Grade 3/6 systolic murmur - chronic and stable.  
-Pertinent previous echo findings (12/2020): Moderate MR, trivial TR/PI, no chamber enlargement. Stage B1.

## ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild diffuse thickening of mitral valve leaflets with minimal prolapse into the left atrial lumen. Mild eccentric mitral regurgitation with minimal left atrial dilation. Normal LV diameter with adequate myocardial function. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic and tricuspid insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Chronic degenerative valve disease causing mild mitral regurgitation persists. Compared to what is described in the previous study, there is no evidence of progression. Lack of significant left atrial enlargement indicates the current risk for complication is low. No additional issues such as systolic dysfunction or pulmonary hypertension are noted in this study.

In a dog with no significant left atrial enlargement, no cardiac medications are clearly indicated. Assessment of progression in the future will help predict long term prognosis, which is highly variable at this stage (B1). Omega fatty acid supplementation and mild salt restriction may be of

some long-term benefit. Monitor for development of a cough, labored breathing, exercise intolerance or collapse episodes.

**SPECIES**

No cardiac contraindication for general anesthesia prior to chamber enlargement.

Recommend conservative monitoring with a recheck echocardiogram in 6-12 months, sooner if any development of clinical signs.
