HOLTER MONITOR FINDINGS AND RHYTHM ASSESSMENT

Time analyzed	23:58h
Mean heart rate	73bpm
Maximum heart rate	245bpm
Minimum heart rate	45bpm
VPCs	1
APCs	1

Interpretation: Underlying normal sinus rhythm with appropriate rate variation.

Rhythm diagnosis: Sinus rhythm with apparently appropriate heart rate variation. A single VPC and APC are identified. No couplets, triplets or sustained tachyarrhythmias are appreciated. No significant pauses, AV block or other bradyarrhythmias are seen.

RECOMMENDATIONS

Essentially normal recording with no malignant arrhythmias identified. The HR is apparently appropriate (diary not included). Finally a single VPC and APC are noted, which are considered incidental in an otherwise healthy dog. No sustained issues are seen here.

INTERPRETED BY

Maggie Machen Lamy,
DVM, DACVIM
(Cardiology)

Monitor for any ausculted arrhythmias, syncope or acute onset lethargy.

No obvious reason for NT-proBNP elevation is seen, most likely making this a false positive result (a known weakness of the test). Other possible causes should be considered, including hypertension or renal disease. If no obvious cause is identified, reassessing this patient in 6-12 months is recommended to ensure early disease was not missed.

IMAGING PERFORMED BY

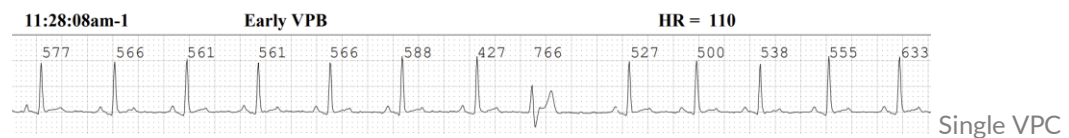

No medications are indicated at this time.

Recheck as dictated by the clinical picture.
