**PRESENTING CLINICAL SIGNS**

History: Elevated BNP: 1320. Assess prior to anesthesia for infected cyst; history of anesthetic complication while having a procedure in Japan (no history available).

**ECHOCARDIOGRAM FINDINGS**

2D, m-mode, color flow and doppler imaging is available. Mild MV thickening with no prolapse into the left atrial lumen. No obvious mitral regurgitation with a normal left atrial dimension. Normal LV diameter with adequate myocardial function. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic and trace pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Overtly normal cardiac dimensions and function, with no obvious dysfunction or dilation of the left heart. No significant valvular leaks are visualized, and no evidence of pulmonary hypertension.

A structural cause for NT-ProBNP elevation is not apparent here, making this potentially a false positive result (a known weakness of the test). Other possible causes for elevated levels of the enzyme should be considered, such as significant arrhythmias, hyperthyroidism, systemic hypertension or renal disease. If no obvious cause is identified, reassessing this patient in 6-12 months is recommended to ensure early disease was not missed.

## PATIENT

No medications are indicated and the prognosis is open from a cardiac standpoint.

Luca Gagnon

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or collapse episodes.

## SPECIES

Canine

A recheck echocardiogram is recommended should a significant murmur develop or signs of cardiac compromise be noted in the future.
