PRESENTING CLINICAL SIGNS

History: History of lymphoma; in remission since August or September after CHOP protocol. Having panting episodes after running up the stairs a few times per week. No arrhythmia or murmur noted. Normal CXR and AUS. normal. Sedated with Alfaxalone, Torb and Trazadone.

-Abnormal PE/Chem/CBC/UA Results: Mild anemia (Hct 33%); elevated creatinine 2.2, elevated BUN 36. Rest of Chem panel WNL.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild MV thickening with no prolapse into the left atrial lumen. No obvious mitral regurgitation with a normal left atrial dimension. Normal LV diameter with borderline myocardial function. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic and trace pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac dimensions with borderline myocardial function. The latter may be due to sedation or may simply be a normal variant. This is inconsistent with a true DCM phenotype, as can be seen with chemotherapy. The LA is normal and no additional issues are seen.

These findings would suggest the reported clinical issues are unlikely to be cardiogenic in origin. Further workup may be warranted.

No medications are indicated and the prognosis is open from a cardiac standpoint.

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or collapse episodes.

A recheck echocardiogram is recommended in 6 months, sooner should a significant murmur develop or signs of cardiac compromise be noted in the interim.
