

PATIENT

Clementine Fogel

PRESENTING CLINICAL SIGNS

History: Syncope - up to 5x daily with pale MM. Continuous monitoring ECG for 3 hours was normal. Just stopped grain-free diet

SPECIES

Canine

ELECTROCARDIOGRAPHIC FINDINGS *Note: Single lead ECGs are evaluated as a rhythm strip. Morphology/MEA cannot be definitively commented on.

A single lead ECG is available; 50mm/s, 20mm/mV. The average heart rate is 140bpm (range 107-176bpm). The rhythm is sinus in origin, with a p for every QRS complex and vice versa. The P and QRS morphologies are positive. No ectopic beats, pauses or other dysrhythmias observed. ECG diagnosis: Normal sinus rhythm with respiratory variation.

BREED

Bulldog Mix

SEX

Female Spayed

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild diffuse thickening of mitral valve leaflets with no prolapse into the left atrial lumen. No mitral regurgitation with no left atrial dilation. Normal LV diameter with adequate myocardial function for this breed. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

AGE

4 years

WEIGHT

54.4lbs

CARDIAC CHART

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

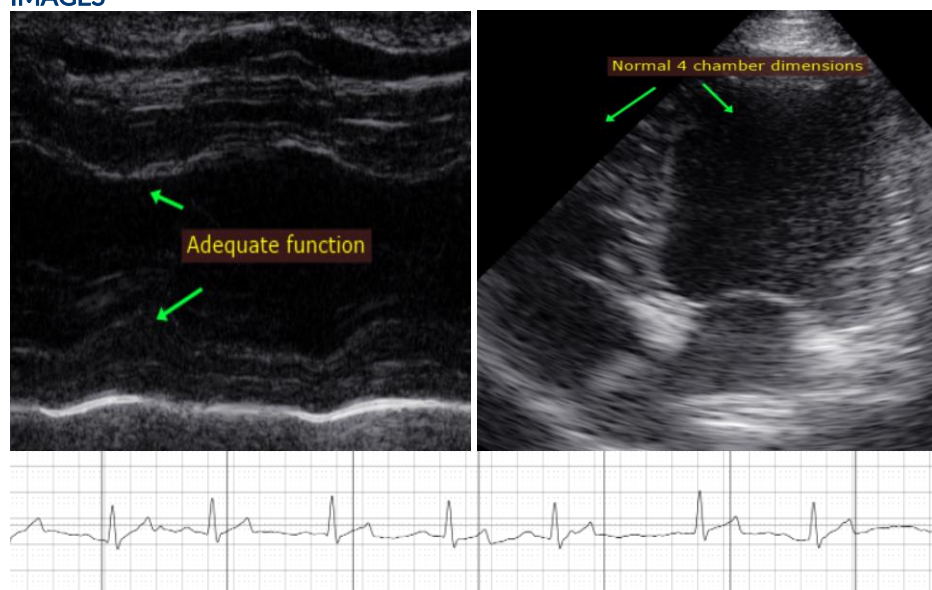

Overtly normal cardiac dimensions and function, with no obvious dysfunction or dilation of the left heart. No significant valvular leaks are visualized, and no evidence of pulmonary hypertension. No obvious congenital defects are observed. The ECG is unremarkable with a normal sinus rhythm.

These findings certainly do not explain frequent syncopal episodes. The ECG is unremarkable and continuous monitoring in hospital was reportedly normal as well, making an arrhythmia unlikely. A holter monitor can still be considered, particularly if no episodes were reported during in hospital monitoring. Neurologic events should also be considered, including full systemic evaluation (lab work and neuromuscular evaluation).

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or recurrent collapse episodes.

A recheck echocardiogram is recommended if a murmur or signs of cardiac compromise be noted in the future.

IMAGES

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. This report was generated using transcription software, and minor dictation errors may be present. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance, please contact me.
