

DATE PRESENTING CLINICAL SIGNS

2.18.26 History: Chronic soft stools, somewhat managed with diet and fiber for 8-10 months. New mildly increased BNP. No obvious heart murmur heard.

PATIENT

Sheldon West

-Pertinent abnormal PE/Chem/CBC/UA Results: ProBNP 115. T4 6.2, FT4 4.9, 63.1. rest WNL.
-Current medications: w/d diet with proviable fiber, some Hills Gastro Biome dry. Just started methimazole 2.5mg BID this week.

SPECIES

Feline

-Sedation used: Not required to complete full diagnostic ultrasound.
-Pertinent previous ultrasound results: No previous.
-STAT: Not requested.
-Imaging performed by: Andi Parkinson, BS, RDMS.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. The left ventricular wall is normal in dimension. There is a mildly hyperechoic endocardium consistent with mild fibrosis. The endocardium also appears mildly remodeled. The papillary muscles are normal in size and hyperechoic. The left atrium is normal in size. The right atrium is normal in size. The right ventricle appears normal. The mitral valve is normal in structure and mobility. No obvious valve regurgitation. Blood flow through both the LVOT and RVOT is normal in velocity. No pleural or pericardial effusion seen. No obvious cardiac tumors.

CARDIAC CHART

WEIGHT

13.46lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac structure and function. The LV wall thickness is normal, and there is no evidence of elevated left atrial pressure or underlying pathology at this time. There is mild remodeling

INVOICE

46887

and fibrosis of the left ventricular wall, which is considered likely a normal age-related finding. Flow through the great vessels is normal, and no significant valve regurgitation is identified.

Given these findings, no medications are indicated. Prognosis is good.

No obvious structural cause for BNP elevation is seen here. A flaw of the BNP test is false positives, which may be the case; however, alternative causes for elevation should be considered, including decreased renal clearance, hypertension, etc. If no obvious cause is identified, reassessing this patient in 6-12 months is recommended to ensure early disease was not missed.

Anesthetic risk is considered mild. Risk for complication with steroid use or fluid administration typically follows LA dilation, which in this case is low. That being said, any cat can experience unexpected signs of intolerance and monitoring of RR/RE is advised particularly in the initiation phase.

Recommend recheck echocardiogram in 1 year to assess for any progressive issues.

IMAGES

The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.

Thank you for this referral. This report was generated using transcription software, and minor dictation errors may be present. If the clinical or image interpretation does not parallel your findings or if I can be of any further assistance, please contact me.
