**DATE**

2/19/26

**PRESENTING CLINICAL SIGNS**

History: Collapse episodes at home (two events yesterday); jumped off the couch, upon landing he began coughing, appeared wobbly, and then suddenly fell onto his side. The owner reports urinary incontinence during the episode. His eyes appeared glazed, and he was unresponsive to his surroundings. The episode lasted several minutes, after which he slowly sat up and returned to normal behavior. Approximately 1.5 hours later, while outside, a similar episode occurred: wobbliness followed by collapse and gradual recovery. Eating, drinking, defecation, and urination are reported as normal overall; however, the owner notes increased urinary frequency recently. No prior history of seizures. Grade 5/6 heart murmur. No arrhythmia. On Metronidazole 250mg PO for GI infection (last dose given at 8:00 AM today). BP: 108mmHg. CXR showed mild cardiomegaly, LAE and CHF.

**ECHOCARDIOGRAM FINDINGS**

2D, m-mode, color flow and doppler imaging is available. The mitral valve is diffusely thickened with prolapse into the left atrial lumen. There is severe eccentric mitral regurgitation present. The MR velocity is normal. There is severe left atrial enlargement. There is mild left ventricular dilation. Left ventricular systolic function is hyperdynamic. Mild right atrial and ventricular dilation (subjective). Mild thickening of the tricuspid valve with mild TR. Velocity consistent with early pulmonary hypertension. The aortic valve appears trileaflet with normal mobility. No significant AI. There is normal systolic flow velocity across the aortic valve. The main pulmonary artery is normal in diameter. The pulmonic valve is normal in appearance. Flow through the RVOT/PV is normal in velocity. Trace PI. No pericardial/pleural effusion or cardiac masses are seen.

**CARDIAC CHART**

<b>CANINE CARDIAC PARAMETERS</b>	<b>MR VMAX</b> (m/s)	<b>TR VMAX</b> (m/s)	<b>LA/AO</b> (Boon method)	<b>LA/AO</b> (Heart Base; Swe)	<b>FS</b> (%)	<b>EF</b> (%)	<b>EPSS</b> (cm)

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The cause of the murmur is chronic degenerative valve disease causing severe mitral and mild tricuspid regurgitation. Severe left atrial enlargement indicates the risk for spontaneous congestive heart failure is elevated. Early pulmonary hypertension is noted, which is likely secondary to chronic LA pressure elevation and active congestion. No additional issues are identified.

While an exact cause of the reported episodes is unclear, if the chest radiographs showed CHF then this is presumed diagnosis and full cardiac medications are warranted lifelong as below. Monitoring of sleeping respiratory rates will be paramount to screen for congestive heart failure at home. Cough suppression to improve QOL can also be considered (hydrocodone, 0.2-0.4mg/kg up to q4-6h PRN) for any residual mechanical cough in the face of normal sleeping respiratory rates. If able to be stabilized, the average survival time of canine patients with active pulmonary edema is 8-9 months on medications; however, most are able to maintain a good quality of life for that period on medications. Patient will always be at risk for recurrent CHF, development of arrhythmias/LA tear, syncope and/or sudden death in the future.

Omega fatty acid supplementation and mild salt restriction may also be of some long-term benefit. Monitor for acute progression of the cough, labored breathing, exercise intolerance or collapse episodes in the future.

**Elective anesthesia is not advised, as there is high risk for complication.**

## PLAN

Institute/continue Pimobendan 0.3mg/kg PO q12h. Institute/continue Furosemide 1-2mg/kg PO q12h. Institute/continue spironolactone 1-2mg/kg PO q12h.

Monitor renal values and BP in 10-14 days, then every 3-4 months while on diuretics to ensure tolerance of medications. If doing well at home, renal values are reasonable and BP > 130mmHg, administer ACEI 0.5mg/kg PO q12h. Consider hydrocodone if needed for QOL.

Recommend conservative monitoring with a recheck echocardiogram in 6 months, sooner if any development of associated clinical signs occurs in the interim.
