PRESENTING CLINICAL SIGNS

History: Recheck echo. No murmur.

-Pertinent previous echo findings (9/2022 MML): Previously normal with a borderline LV (4.9/3.3cm).

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Normal mitral valve leaflets with no prolapse into the left atrial lumen. No obvious mitral regurgitation with a slightly enlarged left atrial dimension. Borderline LV dimension with adequate myocardial function. The tricuspid valve appears normal with mild tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Compared to the prior study, findings are similar, which is good news. All four chambers remain essentially normal with a slight increase in LA dimension. Without underlying pathology, this is likely a normal variation. Mild TR has developed; however, appears insignificant. No additional issues are seen.

Given these findings, no medications are indicated. Prognosis is open.

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or collapse episodes.

A recheck echocardiogram is recommended should a significant murmur develop, or signs of cardiac compromise be noted in the future.
