

PATIENT

Mia Garcia

PRESENTING CLINICAL SIGNS

History: Sinus arrest noted on preadental ECG. Repeat ECG after atropine administration respiratory sinus arrhythmia. Thoracic radiographs NSF. Presents for echo. No murmur.

SPECIES

Canine

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild diffuse thickening of mitral valve leaflets with no prolapse into the left atrial lumen. No mitral regurgitation with no left atrial dilation. Normal LV diameter with adequate myocardial function. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

				50	2.88 (7.1)	6.07 (8.3)	4.46 (7.4)

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The cardiac structure and function in this patient is overtly normal. No significant valvular regurgitation is noted, and the cardiac dimensions and function are normal.

These findings would suggest the arrhythmia is certainly noncardiac in origin. Consider primary arrhythmic causes, systemic issues, etc. as dictated by the ECG report.

No cardiac medications are indicated at this time. Monitor for development of a cough, labored breathing, exercise intolerance or collapse episodes.

PATIENT

Mia Garcia

No structural contraindication for general anesthesia; however, the arrhythmia should be addressed as based on the ECG report.

SPECIES

Canine

A recheck is recommended in 1 year to screen for any progressive issues.
