INVOICE

29636

DATE

3/16/23

PRESENTING CLINICAL SIGNS

History: Elevated ProBNP.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. The left ventricular wall is largely normal in dimension with regions of irregularity. The basilar septum measures increased. There is a diffusely hyperechoic endocardium consistent with fibrosis. The endocardium also appears mildly remodeled and fibrosis. The papillary muscles appear mildly remodeled. The left atrium is normal in size. Blood flow through the LVOT appears normal with no evidence of obstruction. The right atrium is normal in size. The right ventricle appears normal. The tricuspid valve appears normal in structure and mobility. No tricuspid regurgitation. The mitral valve is normal in structure and mobility with no mitral regurgitation. Blood flow through the RVOT is normal. No aortic insufficiency. No evidence of cardiac tumors or metastatic lesions on this scan.

CARDIAC CHART

FELINE CARDIAC PARAMETERS	BODY WEIGHT (kg)	HR (BPM)	IVSd (cm) (Moise, Pipers)	LVIDd (cm) (Moise, Pipers)	LWVd (cm) (Moise, Pipers)	FS (%)	EF (%)
NORMAL PARAMETER	-----	150-240	0.35-0.55	<2 (mean 1.5)	3.5-0.55	35-67	80-100
PATIENT	3.9	208	0.66	1.6	0.48	63	93
FELINE CARDIAC PARAMETERS	LA/AO (Boon)	LA/AO HEART BASE (Swe) (Abbott)	LA 2D short axis Base view (cm) (Abbott)		LVOT VEL (m/s)	RVOT VEL (m/s)	E max (m/s)
NORMAL	<1.5	<1.3	<1.2		<1.6	<1.3	<0.9
PATIENT	1.5	1.4	1.2		1.3	1.1	NM

**Note: All measurements based upon multi-modal images and methods. An average value is reported.*

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The only abnormality appreciated is a focal septal bulge with significant LV remodeling and fibrosis. These findings may be indicative of early hypertrophic pathology or may simply represent a normal variant. Regardless, the left atrial dimension is normal, and there is minimal risk for complication at this time. No additional issues are identified.

Given these findings, no medications are indicated at this time.

These findings may or may not explain BNP elevation pending follow up evaluation. Consider alternative contributing causes in this patient, such as kidney disease or hypertension.

If needed, the risk for general anesthesia is low, however heart rate stimulating drugs such as atropine, glycopyrrolate or ketamine should be avoided unless medically necessary. Even without significant pathology, with this degree of remodeling and diastolic stiffening there is a mildly elevated risk for fluid overload in this patient. Judicious IV fluid use is recommended.

PATIENT

Tennessee Rabe

Additionally, a screening blood pressure is recommended in any older cat prior to general anesthesia.

SPECIES

Feline

Risk for complication with steroid use typically follows LA dilation, which in this case is low. That being said, any cat can experience unexpected signs of intolerance and monitoring of RR/RE is advised particularly in the initiation phase.

BREED

DSH

Recommend recheck echocardiogram in 1 year to screen for any progressive issues.
