PRESENTING CLINICAL SIGNS

Murmur.

ECHOCARDIOGRAPHIC FINDINGS

2D, M-mode, and Doppler study.

There is mild left atrial dilation. The mitral valve appears normal, though moderate mitral regurgitation is present. Left ventricular wall thickness is normal. Left ventricular internal dimensions are normal. Left ventricular systolic function is hyperdynamic. The aorta and aortic valve are normal. Right atrial and right ventricular dimensions are normal. The tricuspid valve is normal. The pulmonary artery and pulmonic valve are normal. No pericardial effusion or cardiac masses are seen.

ASSESSMENT/RECOMMENDATIONS

This examination demonstrates moderate regurgitation of blood across Lumi's mitral valve. Secondary to her regurgitation, Lumi has mild dilation of her left atrium. Given this, Lumi is at mildly increased risk for the development of left-sided congestive heart failure and/or thromboembolic disease, therefore, careful monitoring for these is recommended.

I recommend starting Lumi on clopidogrel (18.75 mg SID), as this medication should help to reduce her risk for cardiac thrombus formation.

A recheck echocardiogram is recommended in 6 months, sooner if new clinical signs compatible with cardiac dysfunction (ex. labored breathing, collapse, limb paralysis) develop.
