PRESENTING CLINICAL SIGNS

History: Collapse episodes started approximately 1 month ago, then one yesterday looked like a fainting goat, she urinated, thought had passed away, after running. Started gagging like could not breath. Elkhorn vet thought laryngeal paralysis.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Normal mitral valve leaflets with no prolapse into the left atrial lumen. Trace central mitral regurgitation with a normal left atrial dimension. Normal LV diameter with adequate myocardial function. The tricuspid valve appears normal with trace tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac dimensions and function, with no obvious significant dysfunction or dilation of the left heart. Trace MR and TR may suggest early valve disease, and follow up is recommended should a murmur develop in the future. No significant valvular leaks are visualized, and no evidence of pulmonary hypertension.

Given these findings, no structural cause for syncope is suspected. Further evaluation is recommended, such as an ECG, BP, upper airway exam, etc. A holter can be considered if an intermittent arrhythmia is of increased suspicion.

PATIENT

Penny Kelley

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or collapse episodes.

SPECIES

Canine

A recheck echocardiogram is recommended if a murmur or signs of cardiac compromise develop in the future.
