PRESENTING CLINICAL SIGNS

History: Patient is on a grain free diet. Murmur noticed and enlarged heart on x ray.

RADIOGRAPHIC FINDINGS *NOTE: Images submitted for supplemental cardiac information only.

Mild cardiomegaly. No obvious evidence of CHF.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Diffuse thickening of mitral valve leaflets with no prolapse into the left atrial lumen. Mild eccentric mitral regurgitation with mild left atrial dilation. Normal MR velocity. Borderline LV diameter in both diastole and systole (LVIDdN: 1.76, LVIDsN: 1.9). Borderline LV dysfunction. The tricuspid valve appears mildly thickened with mild tricuspid regurgitation. Normal velocity. Mild right heart enlargement. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic insufficiency and trace pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Chronic degenerative valve disease causing mild mitral and tricuspid regurgitation. Lack of significant left atrial enlargement indicates the current risk for complication is low. The LV and systolic function are borderline depressed, which may be secondary to valve disease in a larger breed dog or may be secondary to grain-free diet. A diet change is certainly recommended (see WSAVA guidelines). No additional issues are identified.

Given these findings, no cardiac medications are clearly indicated. Assessment of progression in the future will help predict long term prognosis, which is highly variable at this stage (B1). Omega fatty acid supplementation and mild salt restriction may be of some long-term benefit. Monitor for development of a cough, labored breathing, exercise intolerance or collapse episodes.

SPECIES

Canine

Anesthetic risk is considered mild if needed. Cardiac protective drug choices (opioid/benzodiazepine premedication, propofol or alfaxalone induction, isoflurane gas) are recommended. Pre-oxygenate for 5-10 minutes prior to induction. Monitor for arrhythmias, hypotension, and hypoxia both intra and post-operatively and intervene as necessary. Mild IV fluid restriction is recommended to avoid fluid overload. Avoid heart rate stimulating drugs such as atropine unless clinically indicated.

PLAN

Diet change recommended.

AGE

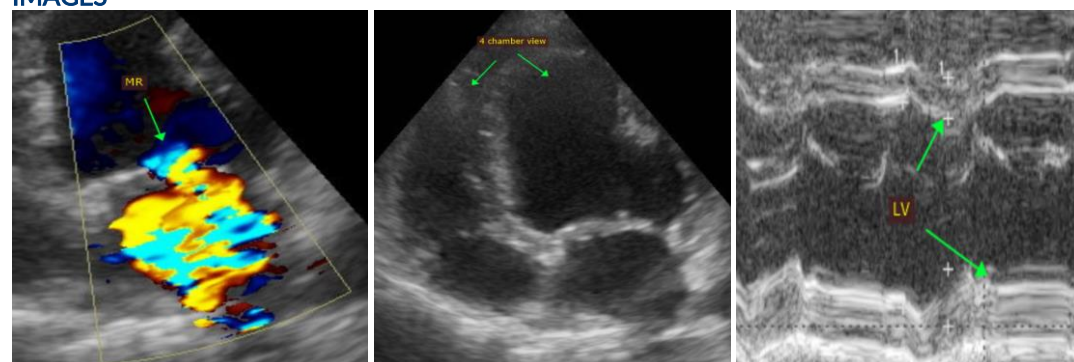

10 years

Recommend conservative monitoring with a recheck echocardiogram in 6 months, sooner if any development of clinical signs.
