**PRESENTING CLINICAL SIGNS**

History: New grade 2/6 heart murmur. Cough. On Cytopoint injection every 4-5 week.

**ELECTROCARDIOGRAPHIC FINDINGS**

A six lead ECG is available at 25mm/s; 10mm/mV. The average heart rate is 110bpm. The rhythm is sinus in origin, with a p for every QRS complex and vice versa. The P wave morphology is positive with a normal dimension. Normal PR. The QRS morphology is positive with normal dimension. MEA is normal. No ectopic beats, pauses or dysrhythmias observed. ECG diagnosis: Normal sinus rhythm with respiratory variation.

**ECHOCARDIOGRAM FINDINGS**

2D, m-mode, color flow and doppler imaging is available. Mild mitral valve leaflet thickening with no obvious prolapse into the left atrial lumen. Trivial mitral regurgitation is identified. Normal left atrial dimension. Normal LV diameter with normal myocardial function. The tricuspid valve appears subjectively normal. No TR. The right heart is normal. No overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. No aortic abnormalities identified, with normal outflow velocity. Normal pulmonic outflow velocities. No aortic insufficiency. Trace pulmonic insufficiency. No pericardial or pleural effusion noted. No cardiac tumors observed.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Overtly normal cardiac structure and function with no cause of a murmur identified. No significant valvular insufficiencies were noted and no structural issues identified. In the absence of significant volume changes (dehydration or anemia), other possibilities include a physiologic flow murmur only present with elevated heart rates, or a small flow abnormality not seen here. These findings would suggest the cough is unlikely to be cardiac in origin and primary respiratory causes should be considered. Consider further respiratory work up/treatment (hydrocodone, taper course of steroids, Enrofloxacin, TTW/BAL, etc.). A poorly controlled cough can lead to development of pulmonary hypertension over time, and monitoring for associated clinical signs is recommended (primarily exertional syncope/dyspnea).

Should the murmur persist/progress in the future, it is reasonable to monitor periodically via recheck echocardiography in the future. The ECG is unremarkable with a respiratory sinus arrhythmia.

No cardiac medications are indicated at this time. Prognosis is open. Monitor for any development of cough, labored breathing or exercise intolerance.

No cardiac contraindication for general anesthesia.

Recommend recheck echocardiogram in 12-18 months to reassess murmur origin and screen for development of concurrent cardiac disease that the preexisting murmur may mask.

**IMAGES**

**The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.**

Thank you for this referral. This report was generated using transcription software, and minor dictation errors may be present. If the clinical or image interpretation does not parallel your findings
