CYTOLOGY SUBMISSION

Subcutaneous mass

OBSERVATIONS

Subcutaneous mass: Submitted are 4 excellent videos of cells collected from the subcutaneous mass on Hazel. The cells are uniformly large with large open spaces filled with lipid. The cell membranes are prominent. Some of the cells have multiple vacuoles of lipid. Other cells are single vacuolated cells. The nuclei are uniform and slightly elongated. The cellularity has a benign pattern.

PATIENT

Hazel Cowan

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Subcutaneous mass - Characteristic of a lipoma.

SPECIES

Canine

COMMENTS

The cellularity is characteristic and essentially diagnostic for a lipoma. The cellularity is a benign collection of adipocytes. There is no suggestion of other neoplasia such as mast cell tumor or soft tissue sarcoma. Excision of the lesion will likely result in a favorable prognosis. As you well know, these growths will commonly occur in other locations. Hazel should be continually monitored for independent growths. Other lesions that may look grossly like a lipoma should be evaluated at least by a cytology because different types of growths may occur in other locations. I expect a favorable prognosis with excision of this mass.
