

PATIENT

Gracie Burzycki

PRESENTING CLINICAL SIGNS

History: Constant panting. Irregular heart rhythm.

SPECIES

Canine

ELECTROCARDIOGRAPHIC FINDINGS

A six lead ECG is available at 25mm/s; 10mm/mV. The average heart rate is 120bpm (range 105-144bpm). The rhythm is sinus in origin, with a p for every QRS complex and vice versa. The P wave morphology is positive with a normal dimension. Normal PR. The QRS morphology is positive with normal dimension. MEA is normal. Occasional brief sinus pauses. No ectopic beats, extended pauses or dysrhythmias observed.

BREED

Labrador Retriever

ECG diagnosis: Normal sinus rhythm with respiratory variation. Occasional brief sinus pauses.

SEX

Female Spayed

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild mitral valve leaflet thickening with no obvious prolapse into the left atrial lumen. No mitral regurgitation is identified. Normal left atrial dimension. Normal LV diameter with normal myocardial function. The tricuspid valve appears subjectively normal. No TR. The right heart is normal. No overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. No aortic abnormalities identified, with normal outflow velocity. Normal pulmonic outflow velocities. No aortic insufficiency. No pulmonic insufficiency. No pericardial or pleural effusion noted. No cardiac tumors observed.

AGE

12 years

WEIGHT

74.2lbs

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac structure and function with no cause of a murmur identified. No significant valvular insufficiencies were noted, and no structural issues identified. In the absence of significant volume changes (dehydration) or anemia, other possibilities include a physiologic flow murmur only present with elevated heart rates, or a small flow abnormality not seen here. It is reasonable to monitor periodically via recheck echocardiography in the future, particularly should the murmur persist/progress.

The ECG is unremarkable with a respiratory sinus arrhythmia. Occasional sinus pauses are noted, which are suspected to be due to high vagal tone. What is seen here should not cause clinical signs. If these findings do not reflect what was ausculted on exam (i.e., premature beats), a longer recording or potentially a holter monitor may be necessary.

No cause for panting is appreciated in this exam. Further evaluation through chest radiographs and baseline labs is recommended.

No cardiac medications are indicated at this time. Monitor for any development of cough, labored breathing or exercise intolerance.

No cardiac contraindication for general anesthesia.

Recommend recheck echocardiogram in 12-18 months to screen for progression or development of concurrent cardiac disease that the preexisting murmur may mask.
