INTERPRETED BY

Maggie Machen Lamy,
DVM, DACVIM
(Cardiology)

HOLTER MONITOR FINDINGS AND RHYTHM ASSESSMENT

Time analyzed	23:53h
Mean heart rate	80bpm
Maximum heart rate	216bpm
Minimum heart rate	42bpm
VPCs	0
APCs	66 singles

Interpretation: Underlying normal sinus rhythm with appropriate rate variation (limited diary available). Rare single APCs noted. Occasional sinus pauses while sleeping with a single ventricular escape beat (a normal response to bradycardia).

Rhythm diagnosis: Sinus rhythm with rare APCs.

RECOMMENDATIONS

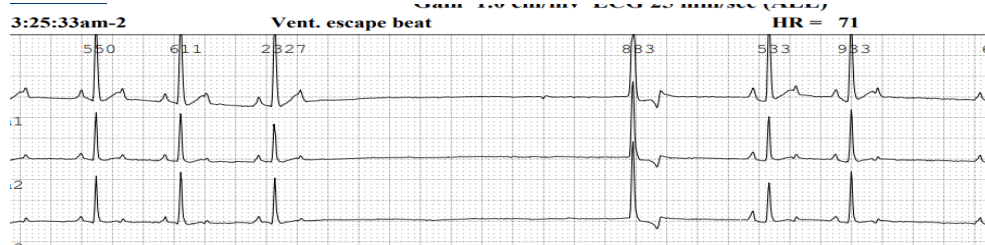

Overall normal recording, with rare single APCs. These are considered normal in senior dogs, and unlikely to cause clinical signs. While presumably sleeping, the patient does have evidence of high vagal tone and sinus pauses which is typically a normal finding. No additional issues are noted.

The cause of the episodes remains unknown as what is seen here is unlikely to cause issues. That being said, an episode did not occur with the monitor in place. Full systemic evaluation is suggested in a senior pet, with an echocardiogram if a heart murmur is present.

No treatment is indicated based upon what is seen here. Reassess based upon clinical progression.
