PRESENTING CLINICAL SIGNS

History: Recheck echo (previous report not included for comparison). History of ventricular hypertrophy and hypertension. Doing well. Grade 3/6 heart murmur. On Amlodipine 2.5mg ¼ tab PO q24h.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. The left ventricular wall is minimally increased in dimension. There is a mildly hyperechoic endocardium consistent with fibrosis. Mild symmetric papillary muscle hypertrophy and remodeling. The right ventricle is subjectively normal in size and morphology. There is no left atrial enlargement present. No right atrial enlargement present. Normal RVOT velocity. Trace TR. Normal LVOT velocity. There is no obvious systolic anterior motion (SAM) of the mitral valve present. No MR. No significant AI or PI. There is no pericardial effusion noted. No pleural effusion appreciated. No obvious cardiac tumors.

CARDIAC CHART

FELINE CARDIAC PARAMETERS	BODY WEIGHT (kg)	HR (BPM)	IVSd (cm) (Moise, Pipers)	LVIDd (cm) (Moise, Pipers)	LVWd (cm) (Moise, Pipers)	FS (%)	EF (%)
NORMAL PARAMETER	------	150-240	0.35-0.55	<2 (mean 1.5)	3.5-0.55	35-67	80-100
PATIENT	5.8	NM	0.60	1.1	0.60	52	88
FELINE CARDIAC PARAMETERS	LA/AO (Boon)	LA/AO HEART BASE (Swe) (Abbott)	LA 2D short axis Base view (cm) (Abbott)		LVOT VEL (m/s)	RVOT VEL (m/s)	E max (m/s)
NORMAL	<1.5	<1.3	<1.2		<1.6	<1.3	<0.9
PATIENT	1.4	1.3	1.2		1.0	0.9	NM

Note: All measurements based upon multi-modal images and methods. An average value is reported.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Hypertrophic cardiomyopathy (HCM) is a rule out diagnosis once a patient is deemed normotensive and euthyroid. In a patient with historical systemic hypertension, this may be related. Routine BP monitoring is advised. Regardless, the degree of disease is mild, with only minimal LVH and no LA dilation. This would indicate the risk for clinical issues is low at this time. Flow through the great vessels is normal, and no significant valve regurgitation is seen. No cause for a murmur is identified, suggesting a physiologic origin is likely.

No medications are typically indicated prior to significant atrial dilation, as many cats will experience naturally slow progression. It is important to note that no medications have been shown to definitively alter long term outcome at this stage, particularly in the absence of SAM. *Regarding the newly available drug Felycin-CA1:* Recent data reports that Felycin-CA1 may improve the degree of LV hypertrophy in some cats with naturally occurring subclinical HCM. The clinical benefit is currently unknown and is still being investigated. The HALT trial is actively enrolling HCM cats all over the US in order to acquire prospective data on a larger sample size of

cats. Should you wish to use the medication, the published dose is 0.3mg/kg weekly, and the drug should be avoided in cats with advanced cardiac changes, diabetes, non-healing wounds, active infections or liver disease. The medication is an immunosuppressant and should be used with caution. For further information, please visit www.triviumvet.com.

Long term prognosis is guarded for subclinical HCM, with a great deal of variability in rate of progression. The REVEAL study showed that approximately 7% of asymptomatic cats with HCM will develop CHF or a cardiogenic thrombus within 1 year, 20% within 5 years, and ~30% within 10 years. Close monitoring for progressive LA dilation going forward will help better predict long term outcome.

Monitor at home for any respiratory issues or signs of blood clot events (neurologic change, paralysis, etc.).

Anesthetic risk is considered mildly elevated; however, judicious fluid administration is advised if needed with careful monitoring to screen for fluid overload. A reasonable protocol includes opioid/benzodiazepine premedication, propofol induction, isoflurane maintenance. Avoid ketamine, telazol, acepromazine and Dexdomitor. Additionally, drugs that stimulate heart rate should be avoided unless clinically necessary (glycopyrrolate, atropine).

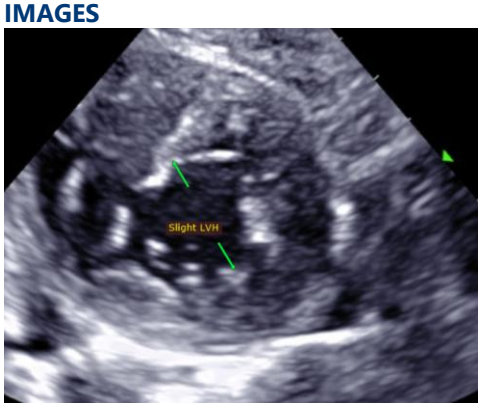
Risk for complication with steroid or fluid use typically follows LA dilation, which in this case is mildly elevated. If needed, monitoring of RR/RE is advised particularly in the initiation phase.

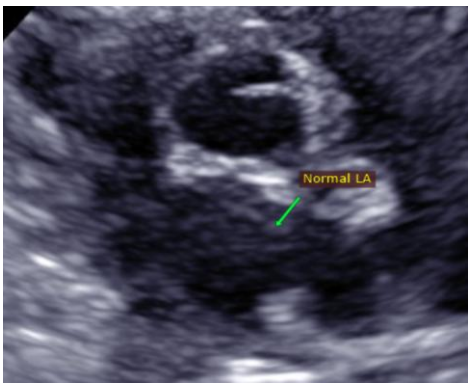
PLAN

A screening blood pressure and T4 are recommended every 6 months lifelong.

A recheck echocardiogram is recommended in 6 months to assess for progression, sooner if any issues arise in the interim.

IMAGES





The information and recommendations provided are based on the images presented by the referring veterinarian. No evaluation can be communicated regarding pathology that was not visible in the image/video clips provided.
