

PRESENTING CLINICAL SIGNS

DATE History: Possible thrombus affecting R hindlimb. Leg appears bruised or light shade of blue when compared to left leg. Non-painful. No murmur. Started on gabapentin and clopidogrel.

4/20/23

ECHOCARDIOGRAPHIC FINDINGS

2D, M-mode, and Doppler study.

PERFORMED BY:

Dr. Meredith Swart

Left atrial size is normal. The mitral valve is normal. Left ventricular wall thickness is normal. Left ventricular internal dimensions are normal. Left ventricular systolic function is hyperdynamic. The aorta and aortic valve are normal. Right atrial and right ventricular dimensions are normal. The tricuspid valve is normal. The pulmonary artery and pulmonic valve are normal. No shunting lesions are visualized. No pericardial effusion or cardiac masses are seen.

ASSESSMENT/RECOMMENDATIONS

Normal echocardiogram

This examination demonstrates no evidence of structural heart disease. While I can't rule out the presence of a thromboembolism, if one is present, it does not appear to be cardiogenic in origin. Therefore, evaluation for the presence of disease processes that can result in hypercoagulability, such as neoplasia, diabetes mellitus, PLE, and PLN, may be warranted.

BREED

DSH

No therapy is recommended based on this exam, though continuation of clopidogrel would be warranted if a thromboembolism is suspected.

SEX

A recheck echocardiogram is recommended if new physical exam and/or clinical abnormalities suggestive of the presence of cardiac dysfunction develop.
