PRESENTING CLINICAL SIGNS

History: history of heart disease and keratoconjunctivitis sicca (KCS) who presented on April 16, 2026, for an acute episode of weakness and lethargy. The patient has a known history of a heart murmur, with an echocardiogram in 2023 showing mild changes, and is managed on enalapril. On April 16, 2026, following a period of excitement, he experienced a sudden episode of freezing in place, stiffness, weakness, and an inability to stand or eat, which the owner suspected was a heart attack. Examination revealed an irregular heartbeat. Chest radiographs showed cardiomegaly but no signs of congestive heart failure, and bloodwork was within normal limits. The plan is to start a compounded form of Vetmedin (pimobendan), as a previous trial with the standard formulation caused vomiting, and to schedule a recheck echocardiogram and ECG to further evaluate for a potential arrhythmia or thromboembolic event. Alfie has a chronic history of KCS, which is managed with long-term topical medications including Optimune and Tacrolimus ophthalmic ointments. Other significant medical history includes a dental procedure with seven extractions and repair of a non-reducible umbilical hernia on March 16, 2022. y overweight. Grade III/VI heart murmur. 4/16/26: Normal Chem and CBC. -CXR report: showed cardiomegaly. No CHF.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Mild diffuse thickening of mitral valve leaflets with mild prolapse into the left atrial lumen. Trace/mild eccentric mitral regurgitation with no left atrial dilation (LA:Ao <1.4). Normal MR velocity. Normal LV diameter with adequate myocardial function. The tricuspid valve appears mildly thickened with no significant tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic and trace pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

CARDIAC CHART

CANINE CARDIAC PARAMETERS	MR VMAX (m/s)	TR VMAX (m/s)	LA/AO (Boon method)	LA/AO (Heart Base; Swe)	FS (%)	EF (%)	EPSS (cm)
NORMAL PARAMETER	4.5-5.5	<2.7	1.3	<1.6	28-40	40-100	<0.6
PATIENT	5.2	NA	NM	1.3	50	90	0.4
CANINE CARDIAC PARAMETERS	HR (BPM)	AV VMAX (m/s)	PV MAX (m/s)	BODY WEIGHT (kg)	LA 2D short axis Base view (cm)	LVIDd Avg; 2D and m-mode short axis (cm)	LVIDs Avg; 2D and m-mode short axis (cm)
NORMAL PARAMETER	50-100	0.7-1.7	0.7-1.6	BELOW	BELOW	BELOW	BELOW
PATIENT	NM	1.7	1.2	7.7	1.5	2.4	1.2
*Normal chamber parameters expressed as a mean value (SD)				3	1.27 (5.3)	2.46 (2.46)	1.36 (5.5)

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Chronic degenerative valve disease causing trace/mild mitral regurgitation. Lack of significant left atrial enlargement indicates the current risk for complication is low. No concurrent issues such as systolic dysfunction or pulmonary hypertension are noted in this study.

These findings would certainly suggest the recent episode is unlikely to be cardiogenic in origin, with minimal disease seen here. Further workup may be necessary, such as an ECG/holter monitor, BP assessment, etc. A vasovagal event should be considered, given that this occurred following significant excitement.

No cardiac medications are clearly indicated, as no benefit has been shown to providing therapy for dogs in stage B1. Pending BP assessment, Pimobendan and Enalapril can be safely discontinued. Omega fatty acid supplementation and mild salt restriction may be of some long-term benefit. Monitor for development of a progressive cough, labored breathing, exercise intolerance or collapse episodes.

Assessment of progression in the future will help predict long term prognosis, which is highly variable with stage B1 disease. Many B1 dogs will remain asymptomatic with slow progression for years to come.

No cardiac contraindication for general anesthesia prior to chamber enlargement.

Recommend conservative monitoring with a recheck echocardiogram in 6-12 months to assess rate of progression, sooner if any development of clinical signs in the interim.
