PRESENTING CLINICAL SIGNS

History: Grade 1-2/6 heart murmur. Asymptomatic.

-Current medications: Prednisone 5mg/ml oil chicken. Give 1 ml twice daily for 7 days, then once daily for 14 days then every other day until finished.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. The left ventricular wall is borderline normal in dimension with regions or irregularity. There is a diffusely hyperechoic endocardium consistent with fibrosis. The endocardium also appears mildly remodeled. The papillary muscles appear mildly remodeled. The left atrium is normal in size. The right atrium is normal in size. The right ventricle appears normal. The tricuspid valve appears normal in structure and mobility. No tricuspid regurgitation. The mitral valve is normal in structure and mobility. Trace mitral regurgitation. A dynamic RVOT obstruction is noted on color-flow and spectral imaging. Blood flow through the LVOT appears normal with no evidence of obstruction. No aortic or pulmonic insufficiency. No evidence of cardiac tumors or metastatic lesions on this scan.

CARDIAC CHART

FELINE CARDIAC PARAMETERS	BODY WEIGHT (kg)	HR (BPM)	IVSd (cm) (Moise, Pipers)	LVIDd (cm) (Moise, Pipers)	LVWd (cm) (Moise, Pipers)	FS (%)	EF (%)
NORMAL PARAMETER	-----	150-240	0.35-0.55	<2 (mean 1.5)	3.5-0.55	35-67	80-100
PATIENT	5.4	NM	0.57	1.3	0.57	58	92

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The only cause of a murmur identified is a suspect heart rate dependent flow obstruction through the right ventricle (DRVOTO), which is a physiologic finding (i.e., benign and of little clinical significance). This type of flow murmur will wax and wane secondary to tachycardia and volume changes. There is however a significant amount of LV remodeling and fibrosis with borderline wall dimensions, which may be indicative of early hypertrophic pathology or simply represent a normal variant. Regardless the left atrial dimension is normal, and there is minimal risk for complication at this time. Serial echocardiography will be necessary to determine progression and clinical relevance in the future. A baseline blood pressure is recommended.

If needed, the risk for general anesthesia is low, however heart rate stimulating drugs such as atropine, glycopyrrolate or ketamine should be avoided unless medically necessary. Even without significant pathology, with this degree of remodeling and diastolic stiffening there is a mildly elevated risk for fluid overload in this patient. Judicious IV fluid use is recommended.

PATIENT

Flower Loaring

Additionally, a screening blood pressure is recommended in any older cat prior to general anesthesia.

SPECIES

Feline

Given these findings, no medications are indicated at this time.

BREED

DSH

SEX

Female

Recommend recheck echocardiogram in 1 year to assess for progression or development of disease the pre-existing murmur may mask.

AGE

8 years
