PRESENTING CLINICAL SIGNS

History: Recheck echo. Doing well. Murmur has progressed to a grade 6/6 . Assess prior to anesthesia. History of CVC thrombus, liver enzyme elevation, increased calcium and hypothyroidism. BP: 146mmHg.
-Current medications: Clopidogrel 15mg daily, levothyroxine BID and Rivaroxaban 5mg/day.
-Pertinent previous echo findings (10/2022 MML): Moderate MR, mild LAE, no LVE, mild TR: 2.2m/s. LA: 1.8, LV; 3.8.

RADIOGRAPHIC FINDINGS *NOTE: Images submitted for supplemental cardiac information only.
Cardiomegaly with LA enlargement. No obvious evidence of CHF.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Diffuse thickening of mitral valve leaflets (anterior>posterior) with mild prolapse into the left atrial lumen. Moderate eccentric mitral regurgitation with moderate left atrial dilation. Normal MR velocity. Borderline LV dilation with adequate myocardial function. The tricuspid valve appears subjectively normal, with no tricuspid regurgitation. Normal right atrial and ventricular diameter. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities. No aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No cardiac tumors observed.

CARDIAC CHART

CANINE CARDIAC PARAMETERS	MR VMAX (m/s)	TR VMAX (m/s)	LA/AO (Boon method)	LA/AO (Heart Base; Swe)	FS (%)	EF (%)	EPSS (cm)
NORMAL PARAMETER	4.5-5.5	<2.7	1.3	<1.6	28-40	40-100	<0.6
PATIENT	4.9	NA	NM	1.8	47	90	NM

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Chronic degenerative valve disease persists with evidence of progression. While moderate MR is similar to previous, the left atrium is progressively dilated. No additional issues are identified.

Based upon these findings, recommend institution of Pimobendan as below. Continued assessment of progression is recommended, with a guarded prognosis going forward (stage B2). Patient may be at risk for development of CHF, arrhythmias, and/or sudden death going forward.

Omega fatty acid supplementation and mild salt restriction may also be of some long-term benefit. Monitor for development of a progressive cough, labored breathing, exercise intolerance or collapse episodes.

Once on the medication for 3-5 days, anesthetic risk remains mildly elevated. Cardiac protective drug choices (opioid/benzodiazepine premedication, Propofol or alfaxalone induction, iso or sevo gas) are recommended. Monitor for arrhythmias, hypotension, and hypoxia both intra and post-operatively and intervene as necessary. Judicious IV fluid rates are recommended to avoid fluid overload. Avoid heart rate stimulating drugs such as atropine unless clinically indicated.

Typically, blood thinners should be discontinued at least 5 days prior to anesthesia. Further recommendations should be based upon prior evaluation (ie these are independent of heart disease). Further discussion with the IM Specialist managing the case is recommended prior to anesthesia, with involvement of an anesthesiologist if necessary.

PLAN

Baseline BP recommended every 6 months. Institute Pimobendan 0.25-0.3mg/kg PO q12h.

Recommend monitor for progression with a recheck echocardiogram in 6 months, sooner if any development of clinical signs.
