HOLTER MONITOR FINDINGS AND RHYTHM ASSESSMENT

Time analyzed	23:55h
Mean heart rate	58bpm
Maximum heart rate	270bpm
Minimum heart rate	29bpm
VPCs	00
APCs	0

Interpretation: Underlying normal sinus rhythm with appropriate rate variation. No ectopy, extended pauses, AV block or other dysrhythmias appreciated. Ventricular escape beats are appropriate, and occur during prolonged bradycardia while sleeping.

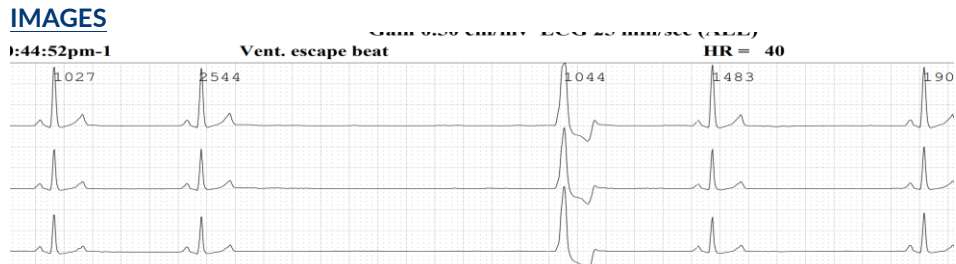

RECOMMENDATIONS

Apparently normal recording. No significant pauses are noted, and no malignant arrhythmias identified. The max HR appears sinus in origin, without obvious SVT or VT. Escape beats during bradycardia is a physiologic response. No AV block noted.

If the patient continues to experience collapse episodes without a clear cause, consider use of a mobile device such as an AliveCor (kardia) or implantation of an event monitor. That being said, suspicion is low in this case and other possibilities should be considered such as a musculoskeletal abnormality, BP swings, heat intolerance, etc.

No medications are indicated at this time.
