PRESENTING CLINICAL SIGNS

History: Echo performed when respiratory distress was noted after consuming a candle. Possible aspiration. Pronounced sinus arrhythmia was noted during the echo.
Pertinent echo findings (EL 5/30/22): NSF

HOLTER MONITOR FINDINGS AND RHYTHM ASSESSMENT

Time analyzed	23:07h
Mean heart rate	102pm
Maximum heart rate	216bpm
Minimum heart rate	52bpm
VPCs	0
APCs	346bpm

Interpretation: Underlying normal sinus rhythm with appropriate rate variation.

Rhythm diagnosis: Sinus rhythm with

RECOMMENDATIONS

Interpretation: Underlying normal sinus rhythm with appropriate rate variation. APCs throughout; singles only.

Rhythm diagnosis: Sinus rhythm with isolated APCs.

RECOMMENDATIONS

Apparently normal recording. No significant pauses are noted, and no malignant arrhythmias identified. A max HR of 216bpm appears sinus, and follows a noted walk. Isolated APCs are noted throughout, which would not be responsible for any clinical issues. APCs are a very non-specific finding. They can be primary in origin (arrhythmic disease; a rule out diagnosis), develop secondary to significant cardiac disease (not reportedly present), or be extra-cardiac in origin; i.e. due to pain, stress, inflammation, cancer, GI disease, DIC/sepsis, etc. If the patient is still experiencing discomfort or any symptoms associated with the prior event, this may be related. Otherwise, in a senior dog without structural cardiac disease, ruling out all differentials can be considered.

No medications are indicated at this time.

Recheck in 6-12 months, sooner if any associated clinical signs arise such as acute lethargy or collapse.
