ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and doppler imaging is available. Normal mitral valve leaflets with no obvious prolapse into the left atrial lumen. No obvious mitral regurgitation. Normal left atrial dimension. Normal LV diameter with normal myocardial function. The LV wall appears normal. The tricuspid valve appears normal. No TR seen. Moderate right atrial dilation. Significant right ventricular enlargement/hypertrophy indicative of pressure overload. Pulmonic outflow velocities are severely elevated at the level of the valve. The pulmonic valve leaflets cannot be visualized extensively; however, the entire apparatus is highly abnormal and thickened with decreased motion. Mild pulmonic insufficiency. There is significant post-stenotic dilation of the main pulmonary artery. The aortic valve appears to have normal morphology and mobility. No obvious cardiac shunts are present. No pericardial or pleural effusion noted.

CARDIAC CHART

CANINE CARDIAC PARAMETERS	MR VMAX (m/s)	TR VMAX (m/s)	LA/AO (Boon method)	LA/AO (Heart Base; Swe)	FS (%)	EF (%)	EPSS (cm)

				40	2.62 (5.2)	5.48 (6.1)	3.96 (5.4)
				50	2.88 (7.1)	6.07 (8.3)	4.46 (7.4)

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

The cause of the murmur is severe pulmonic stenosis. The degree of obstruction is severe based upon the velocity/pressure gradient across the pulmonic valve and the secondary hypertrophy and remodeling of the right ventricle. The stenosis appears valvular with a highly abnormal apparatus. There is significant RA/RV enlargement, indicating significant pressure overload and the risk for CHF will be elevated going forward. No additional abnormalities were visualized.

Referral for consultation and balloon valvuloplasty should be considered in this patient as the gold standard therapeutic option for this condition and may improve long term outcome and

PATIENT

Tilly Walker

delay onset of clinical signs (including exertional syncope and right-sided congestive heart failure). It should be mentioned that bulldog breeds are predisposed to an abnormal coronary artery pattern that can further obstruct flow through the vessel and would limit surgical options if present. An angiogram must be performed to rule out this possibility prior to surgery.

SPECIES

Canine

If surgery is not elected, this patient's condition will likely limit lifespan, with many severe PS cases developing CHF by mid-life (particularly with this degree of changes at 4mo old). Medical management with atenolol is recommended to decrease heart rate and lessen the obstruction as below. I don't typically institute this medication at such a young age; however, given the degree of obstruction and RV changes I do feel this is warranted. Monitor for development of associated clinical signs (collapse, abdominal distention, cough, labored breathing). Mild exercise restriction is advised.

SEX

Female

Anesthetic risk is mild to moderate at this time. **Avoid heart rate stimulating drugs such as atropine or glycopyrrolate unless absolutely necessary.** Avoid vasodilators such as acepromazine. Mild IV fluid restriction is advised. Cardiac protective drug choices (opioid/benzodiazepine premedication, propofol or alfaxalone induction, isoflurane gas) are recommended. Pre-oxygenate for 5-10 minutes prior to induction and recover in O₂ if possible. Monitor for arrhythmias, hypotension, and hypoxia both intra and post-operatively and intervene as necessary.

AGE

7 months

WEIGHT

7.2lbs

PLAN

Institute atenolol to effect: 25mg tabs, ¼ tab PO SID to start (up-titrate to desired effect). Goal is to suppress heart rate <120bpm even with stress/activity. Baseline chest radiographs and ECG are recommended. Referral for angiogram/balloon valvuloplasty ASAP if desired.

INTERPRETED BY

Maggie Machen Lamy,
DVM, DACVIM
(Cardiology)

If surgery is declined, recommend recheck echocardiogram in 6 months (or when full stature) to assess for progression, response to medication.
