**PRESENTING CLINICAL SIGNS**

History: Grade 2/6 heart murmur. Asymptomatic. Grain-free diet – homemade chicken and vegetables.

-Abnormal PE/Chem/CBC/UA Results: NSAID chem: ALKP=1604 (H), BUN=6 (L), Crea=0.4 (L), rest WNL. ALKP=633 in 4/2021 before Galliprant trial. ALKP=499 in 5/2021 after Galliprant trial. Currently on Galliprant but increase in ALKP not likely from Galliprant due to post NSAID lab results in 2021. Also, on Denamarin.

**ECHOCARDIOGRAM FINDINGS**

2D, m-mode, color flow and doppler imaging is available. Diffuse thickening of mitral valve leaflets (anterior>posterior) with minimal prolapse into the left atrial lumen. Moderate eccentric mitral regurgitation with moderate left atrial dilation. Normal MR velocity. Mildly increased LV diameter with hyperdynamic myocardial function. The tricuspid valve appears subjectively normal, with trace tricuspid regurgitation. Normal velocity. Normal right atrial and ventricular diameter. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities. No aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No cardiac tumors observed.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Chronic degenerative valve disease causing moderate mitral and trace tricuspid regurgitation. Moderate left atrial enlargement indicates there is relatively low risk for imminent complication, however risk for progression to spontaneous congestive heart failure in the future is elevated. No additional issues are identified. No evidence of diet-related cardiomyopathy at this time; however, a diet change remains the conservative recommendation to a traditional option.

**PATIENT**

Tillie Weil

Given the risk for progression and results of the EPIC trial, Pimobendan is indicated in this patient as below. Assessment of progression in the future will help predict long term outcome, however prognosis is guarded at this stage (B2).

**SPECIES**

Canine

Omega fatty acid supplementation and mild salt restriction may also be of some long-term benefit. Monitor for development of a progressive cough, labored breathing, exercise intolerance or collapse episodes.

**BREED**

Cavalier

Once on the medication for 3-5 days, anesthetic risk is considered mildly elevated. Cardiac protective drug choices (opioid/benzodiazepine premedication, Propofol or alfaxalone induction, iso or sevo gas) are recommended. Monitor for arrhythmias, hypotension, and hypoxia both intra and post-operatively and intervene as necessary. Judicious IV fluid rates are recommended to avoid fluid overload. Avoid heart rate stimulating drugs such as atropine unless clinically indicated.

**AGE**

7.3 years

**PLAN**

Baseline BP recommended. Diet change as discussed. Institute heart muscle support Pimobendan 0.25-0.3mg/kg PO q12h.

**WEIGHT**

32lbs

Recommend monitor for progression with a recheck echocardiogram in 6 months, sooner if any development of clinical signs.
