

DATE PRESENTING CLINICAL SIGNS

7/13/22

Not eating much (atypical for him) and weight loss. History of idiopathic hypercalcemia, previously controlled with diet. On Dexamethasone twice weekly for presumed IBD and recently Gabapentin seems to help his appetite (pain?). FNA of Spleen.
BW: elevated iCa, rest WNL.

INTERPRETED BY

AUS: generalized mild-moderate splenomegaly, thickened SI and coarse echotexture to liver.

Ph.D, DACVP

CYTOLOGY SUBMISSION

FNA of Spleen

PATIENT

Bandit Lauze

OBSERVATIONS

Spleen: Submitted are 9 excellent videos of minimal to moderate nucleated cellular collection from the spleen in Bandit. The nucleated cellularity is mixed. There are scattered aggregates of lymphocytes interspersed with neutrophils and eosinophils and even nucleated red blood cells. Eosinophils are readily identified in many fields. The lymphocytes are small mature lymphocytes throughout the collection. Malignant characteristics are not identified in this collection.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Spleen - Mixed cell collection with evidence of eosinophilic inflammation and neutrophils with some mature lymphocytes.

SEX

Male Neutered

COMMENTS

The cellularity in the spleen demonstrates an inflammatory process which in general appears to be eosinophilic or inflammatory. There is no suggestion of malignancy. This could suggest the possibility of a diffuse eosinophilic infiltration into many organs including the spleen, liver and intestine. Eosinophilic inflammatory bowel disease can be considered. There is an outside possibility of a T-cell lymphoma with small cells, but I cannot confirm that diagnosis. A guarded prognosis is warranted since the specific underlying process has not been identified.
