

PATIENT PRESENTING CLINICAL SIGNS

Bailey Black
History: 3/6 mumur, anorexia
Medication: Mirtazapine, Cerenia

SPECIES ECHOCARDIOGRAPHIC FINDINGS

Feline 2D, M-mode, and Doppler study.

BREED Left atrial size is normal. The mitral valve appears normal, though a weak Doppler signal of mitral regurgitation is present. Left ventricular wall thickness is normal. Left ventricular internal dimensions are normal. Left ventricular systolic function is normal. The aorta and aortic valve appear normal. Right atrial and right ventricular dimensions are normal. The tricuspid valve is normal. The pulmonary artery and pulmonic valve are normal. No shunting lesions are visualized. No pericardial effusion or cardiac masses are seen.

ASSESSMENT/RECOMMENDATIONS

INTERPRETED BY

Keith Blass, DVM,
MS, DACVIM

This examination demonstrates regurgitation of blood across Bailey's mitral valve. The hemodynamic effects of the regurgitation appear to be mild, as Bailey does not have secondary dilation of her left atrium, indicating that her current risk for the development of congestive heart failure and/or thromboembolic disease appears to be low.

IMAGING PERFORMED BY

Rebekah Jakum, CVT
ARDMS/RVT

No reason for Bailey's anorexia is appreciated in the image set.

No therapy is recommended based on this exam.

A recheck echocardiogram is recommended in 9 months, sooner if new clinical signs compatible with cardiac dysfunction develop.
