PRESENTING CLINICAL SIGNS

History: Sumi-e was noted to have a heart murmur in April. She was the runt of the litter. Good appetite and normal activity level. Her littermate has been diagnosed with FIP. Grade I/VI heart murmur noted. BP: 120mmHg x 4. *Sedated with propofol for study.

ECHOCARDIOGRAM FINDINGS

2D, m-mode, color flow and Doppler imaging is available.

Left ventricle: The LV diameter is normal with adequate myocardial function. The LV wall thicknesses are irregular with a normal septum and mild free wall thickening. There is a mildly hyperechoic endocardium consistent with mild fibrosis. The papillary muscles are mildly hypertrophied. The endocardium appears mildly remodeled.

Left atrium: The left atrium and auricle are mildly dilated. No spontaneous contrast or thrombi seen.

Mitral valve: The anterior leaflet of the mitral valve is mildly thickened and elongated. Abnormal anterior motion is seen during systole. Mild to moderate eccentric mitral regurgitation.

Aortic valve/Aorta: The aortic valve is normal in morphology and mobility. Mildly elevated LVOT outflow velocities with a dynamic profile. No aortic insufficiency.

Right ventricle: Normal right ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension.

Right atrium: The right atrium is normal in dimension.

Tricuspid valve: The tricuspid valve appears normal with no tricuspid regurgitation.

Pulmonary valve/Pulmonary artery: The pulmonic valve is normal in morphology and mobility. No pulmonic insufficiency. Normal RVOT velocity; laminar flow.

Pericardium/other: No pericardial or pleural effusion noted. No obvious cardiac masses.

Heart rhythm: ECG reveals a sinus rhythm with an average HR of 120bpm.

2-Dimensional Measurements

Ao diam (cm)	0.8
LA diam (cm)	1.3
LA:Ao (Swe)	1.7
IVS thickness (cm)	0.43
LVID diastole (cm)	1.2
PW thickness (cm)	0.65
LVID systole (cm)	0.55
FS (%)	54

Doppler Measurements

PV Vmax (m/s)	0.9
AoV Vmax (m/s)	3.0
MR Vmax (m/s)	NA
TR Vmax (m/s)	NA
TR PG (mmHg)	NA

INTERPRETATION OF THE FINDINGS

The diagnosis and cause of the murmur is mitral valve dysplasia leading to an obstructive LVOT flow pattern and mild/moderate MR. A primary hypertrophic component cannot be ruled out as a concurrent issue; however, with only mild LV changes this is unlikely. There is mild left atrial and auricular dilation, indicating the risk for imminent complication is low; however, there is concern for risk for progression to spontaneous CHF and/or a thrombotic event going forward. No additional issues are identified.

Long term prognosis is guarded given the age of the patient and highly variable nature of asymptomatic feline heart disease. Many cats will remain asymptomatic until mid-life or beyond, while others develop CHF within the first years. Close monitoring for progression of LA dilation in the future will help determine long term prognosis.

While no medications have been shown to definitively alter long term outcome at this stage of disease, atenolol is often initiated to decrease the outflow obstruction. In cases of solely primary MV dysplasia this can lead to improvement in the degree of obstruction and hypertrophy. Given today's findings, recommend institution at this time if possible. No additional medications are indicated prior to significant LA dilation.

RECOMMENDATIONS

- Administer titrating dose of atenolol: 25mg tablets; Give ¼ tab once daily. Recheck heart rate in 1-2 weeks with target stressed rate of 140-160bpm 12-24 hours post-administration. Increase as needed until target reached.
- Anesthetic risk is considered mildly elevated, however judicious IV fluid rates are advised to avoid fluid overload. Additionally, drugs that stimulate heart rate should be avoided unless clinically necessary (glycopyrrolate, atropine). Avoid vasodilators as this may worsen the obstruction. A reasonable protocol includes opioid/benzodiazepine premedication, propofol induction, isoflurane maintenance.
- Monitor for any clinical evidence of cardiac compromise, including respiratory changes and/or signs of a blood clot event (paralysis, neurologic changes, etc.).

PLAN

- Recommend recheck echocardiogram in 6 months to assess for progression/regression, sooner if clinical signs arise in the interim.
