SEX

Female Spayed

PRESENTING CLINICAL SIGNS

History: Ventricular arrhythmias documented in the ECG report.

ECHOCARDIOGRAM FINDINGS **Image quality limited by patient confirmation.*

2D, m-mode, color flow and doppler imaging is available. Normal mitral valve leaflets with no prolapse into the left atrial lumen. No obvious mitral regurgitation with a normal left atrial dimension. Normal LV diameter with adequate myocardial function. An atypical hyperechoic papillary muscle seen on left apical views. The tricuspid valve appears normal with no tricuspid regurgitation. Normal right atrial and ventricular diameter and morphology indicating no overt evidence of pulmonary arterial hypertension. The pulmonic and aortic valves are normal in morphology and mobility. Normal pulmonic and aortic outflow velocities with laminar flow. No obvious aortic or pulmonic insufficiency. No pericardial or pleural effusion noted. No obvious cardiac masses.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Overtly normal cardiac dimensions and function, with no obvious dysfunction or dilation of the left heart. No significant valvular leaks are visualized, and no evidence of pulmonary hypertension. An atypical papillary muscle is seen from left apical imaging. Suspicion is that this is simply a normal structure seen with an abnormal cross section; however, other possibilities cannot be ruled out (mass or other soft tissue lesion). Simple monitoring is advised.

No structural cause for arrhythmias is seen here, making the findings an either a primary arrhythmic disorder or potentially secondary to systemic issues. Follow up and treatment should be dictated by the ECG Report.

PATIENT

Isabela Sofia Hatton
Acevedo

Monitor for development of a heart murmur, cough, labored breathing, exercise intolerance or collapse episodes.

SPECIES

Canine

Recommend conservative monitoring with a recheck echocardiogram in 1 year, sooner if any development of clinical signs.
