

PATIENT PRESENTING CLINICAL SIGNS

Kobe Bressack History: persistent inappetence and weight loss- enlarged peripheral LNs- recently dx UTI- Gave dex/torb
Abnormal PE/Chem/CBC/UA Results: Grossly enlarged PLN

SPECIES ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Canine ****Non-abdominal images were not commented on owing to request for abdominal study only.

BREED Urinary System

Aussie Doodle The urinary bladder, trigone, and pelvic urethra are normal in thickness and the mucosal surface is smooth. The bladder lumen is moderately distended with anechoic urine. No masses, inflammatory changes or calculi are observed. Ureteral papillae and visualized portion of the proximal urethra, visible to a depth of 2 cm, are normal.

SEX

Female, spayed The left kidney is normal size (5.29 cm in length); normal shape and architecture with smooth peripheral margins. There is a normal 1:3 cortex to medulla ratio with normal corticomedullary distinction. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter.

AGE

2 Years The right kidney is normal size (5.48 cm in length); normal shape and architecture with smooth peripheral margins. There is a normal 1:3 cortex to medulla ratio with normal corticomedullary distinction. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter.

WEIGHT

43 Pounds **Adrenal Glands**

The left adrenal gland is normal size (0.37 cm at cranial pole) (0.41 cm at caudal pole) (2.55 cm in length); normal shape; homogenous parenchyma. The glandular echogenicity and detail are unremarkable. Capsule, cortex, and medullary definition are normal. The phrenicoabdominal vein and surrounding vasculature are normal.

INTERPRETED BY

Andrea Nicastro, DVM,
Diplomate ACVIM
(Small Animal Internal
Medicine)

The right adrenal gland is normal size (0.58 cm at cranial pole) (0.52 cm at caudal pole) (2.57 cm in length); normal shape; homogenous parenchyma. The glandular echogenicity and detail are unremarkable. Capsule, cortex, and medullary definition are normal. The phrenicoabdominal vein and surrounding vasculature are normal.

IMAGING PERFORMED BY

Spleen

HOSPITAL NAME

Donner Truckee VH

The spleen is normal in size (1.56 cm in width at the level of the hilus) with a normal capsular contour. There is appropriate echogenicity and echotexture. A 0.23 cm ill-defined hypoechoic nodule/area is observed approximately mid-spleen. Splenic vasculature is normal.

Liver

REFERRING VET

Dr. Vannini

The liver is subjectively normal in size with normal contours and structure. There is appropriate echogenicity and echotexture. No overt structural evidence of inflammatory, infiltrative or regenerative pathology is evident. Vascular and biliary tracts are of normal volume with no evidence of congestion. No pathological hepatic lymphadenopathy observed. The gall bladder lumen is moderately distended. The wall is thin and smooth. Luminal contents are anechoic. The cystic and common bile ducts are normal/not seen.

PATIENT *Gastrointestinal*

Kobe Bressack The stomach and intestine are free of stasis and exhibit normal peristaltic activity. The gastric lumen is not distended. The gastric wall and pylorus are normal in thickness with a normal layering pattern. The pyloric outflow tract is patent. The small intestinal lumen is gas distended. The small intestinal wall thickness is normal with a normal layering pattern and appropriate mural detail. Discreet masses are not identified. The colonic wall is normal. No obstructive disease is noted.

SPECIES

Canine

Pancreas

BREED

Aussie Doodle

The region of the pancreas is isoechoic relative to surrounding omental fat. No obvious parenchymal abnormalities are observed. There is no evidence of regional inflammation or effusion.

SEX

Female, spayed

Free Abdomen

There is no evidence of free fluid. Several enlarged, irregular, hypoechoic lymph nodes are observed in the mid to caudal abdominal cavity, the largest measuring 3.36 cm in length.

AGE

2 Years

ULTRASONOGRAPHIC FINDINGS

Primary Findings:

- The abdominal lymphadenopathy, in conjunction with the peripheral lymphadenopathy, is most concerning for infiltrative neoplasia (i.e., lymphoma). However, pyogranulomatous lymphadenitis cannot be completely excluded.

Secondary Findings:

- The hypoechoic splenic nodule trends toward the benign (i.e., focus of lymphoid hyperplasia or extramedullary hematopoiesis) with low potential for emerging neoplasia.

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

- Three-view thoracic radiographs are recommended to assess cardiopulmonary status.
- If cytology of the peripheral lymph nodes reveals lymphoma, consultation with a board-certified oncologist is recommended.
