

**PATIENT**

Tatum Kachinski

**SPECIES**

Canine

**BREED**

Scottish Terrier

**SEX**

Female

**AGE**

9 years

**WEIGHT**

25.3 lbs

**INTERPRETED BY**

Andrea Nicastro, DVM,  
Diplomate ACVIM  
(Small Animal Internal  
Medicine)

**IMAGING PERFORMED BY**

Kim Liedberg

**HOSPITAL NAME**

SVS Imaging WI

**REFERRING VET**

Dr Baum, Lyons  
Veterinary Service

**INVOICE**

11885

**DATE**

12.21.22

**PRESENTING CLINICAL SIGNS**

History: Presented for wellness exam. History of elevated liver enzymes from previous veterinarian. Current BW shows liver enzymes to be even more elevated. On no medications at the present.

Abnormal PE/Chem/CBC/UA Results: ALK Phos 3041 CBC elevated HGB and HCT

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The urinary bladder wall is normal in thickness and the mucosal surface is smooth. The bladder lumen is moderately distended with anechoic urine. No masses, inflammatory changes or calculi are observed. Ureteral papillae and visualized portion of the proximal urethra, visible to a depth of 2 cm, are normal.

The left kidney is normal size (5.61 cm in length) with a normal shape, architecture and smooth peripheral margins. There is a normal 1:3 cortex to medulla ratio with mild loss of corticomedullary distinction. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter.

The right kidney is normal size (5.61 cm in length) with a normal shape, architecture and smooth peripheral margins. There is a normal 1:3 cortex to medulla ratio with mild loss of corticomedullary distinction. There is no evidence of pyelectasia, nephroliths, infarcts or hydroureter.

**Adrenal Glands**

The left adrenal gland is normal size (0.40 cm at cranial pole) (0.58 cm at caudal pole) with a normal shape and homogenous parenchyma. The glandular echogenicity and detail are unremarkable. Capsule, cortex, and medullary definition are normal. The phrenicoabdominal vein and surrounding vasculature are normal.

The right adrenal gland is normal size (0.58 cm at cranial pole) (0.52 cm at caudal pole) with a normal shape and homogenous parenchyma. The glandular echogenicity and detail are unremarkable. Capsule, cortex, and medullary definition are normal. The phrenicoabdominal vein and surrounding vasculature are normal.

**Spleen**

The spleen is normal in size (1.22 cm in width at the level of the hilus) with a normal capsular contour. There is appropriate echogenicity and echotexture. A few small myelolipomas are observed in the region of the hilus. Splenic vasculature is normal.

**Liver**

The liver is subjectively enlarged with slightly swollen peripheral contours. The parenchyma is isoechoic relative to the spleen and diffusely homogeneous in appearance. No distinct focal lesions are observed. Vascular and biliary tracts are of normal volume with no evidence of congestion.

The gall bladder lumen is moderately distended. The wall is thin and smooth. A moderate amount of aggregated, echogenic, partially dependent to suspended sludge is observed within the lumen. The cystic and common bile ducts are normal/not seen.

**Gastrointestinal**

The gastric lumen is not distended. The gastric wall is normal in thickness with a normal layering pattern. The small intestinal lumen is not dilated. The small intestinal wall thickness is normal with a normal layering pattern and appropriate mural detail. Discreet masses are not identified. The colonic wall is normal. There is no evidence of an obstructive pattern.

**Pancreas**

The region of the pancreas is isoechoic relative to surrounding omental fat. No obvious parenchymal abnormalities are observed. There is no evidence of regional inflammation or effusion.

**Free Abdomen**

The peritoneal cavity is normal. There is no evidence of inflammation or effusion. The abdominal lymph nodes are normal/not visible.

**ULTRASONOGRAPHIC FINDINGS**

**Primary Findings**

- The hepatic parenchymal changes are most consistent with a benign process (i.e., vacuolar hepatopathy). This is a common finding in older Scottish Terriers and possibly reflects a genetic defect that alters steroidogenesis. This pathology can sometimes progress to hepatocellular carcinoma or fibrosis.
- The gall bladder changes could be consistent with a developing mucocele, cholestasis, or less likely, fasting.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

- Regarding the gall bladder sludge, consider initiation of Ursodiol therapy with serial sonographic monitoring (i.e., every 3 months) of the gall bladder to assess for progression.
- Continued monitoring of the patient's liver enzymes every 3-4 months is recommended. If values continue to increase, a repeat ultrasound should be considered to assess for progressive disease.
