

DATE PRESENTING CLINICAL SIGNS

6/2/26 **Patient History:** Pleural effusion, poss cranial mediastinal mass.

PATIENT Current Medications: None listed.

Theo George **Labwork Results:** Labwork not attached. Radiographs attached.

Date of Previous IntraPet Ultrasound: No previous.

Sedation: Not required to complete full diagnostic ultrasound.

Stat Report: Declined at this time.

SPECIES Imaging Performed by: Stephanie Warga RDCS, RVT.

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

BREED

Domestic shorthair

In both hemithoraces, a moderate to large amount of echogenic pleural effusion is present. In the right cranial thorax, a 5.3 x 4.2 cm heterogeneous slightly cavitated mass is visualized. There is no obvious evidence of pericardial effusion.

SEX

Male, neutered

ULTRASONOGRAPHIC FINDINGS

AGE

6/1/2020

- Mass in the right cranial thorax, the origin of which is unclear. Possible origins include lung, lymph node, thymus, other. Neoplasia (i.e., adenocarcinoma, lymphoma, thymoma) is strongly suspected with a lower possibility of a non-neoplastic process (i.e., inflammatory).

WEIGHT

11.5 lbs.

- Bilateral pleural effusion, likely secondary to the right thoracic mass.

INTERPRETED BY

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Andrea Nicastro, DVM,
Diplomate ACVIM
(Small Animal Internal
Medicine)

Ideally, fine needle aspiration of the mass and/or pleural fluid would be performed in an attempt to get a definitive diagnosis. Depending on results, consultation with a board-certified oncologist and/or surgeon may be warranted. If further testing is not pursued, palliative care (i.e., therapeutic thoracocenteses) is recommended.
