

PATIENT	PRESENTING CLINICAL SIGNS
Bailey Baracaldo	pancreatitis vomiting
SPECIES	ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN
Canine	Urinary System
BREED	The urinary bladder is moderately distended with anechoic contents. No masses, inflammatory changes, echogenic sediment or cystoliths are observed. The urinary bladder, trigone and visible pelvic urethra are normal in thickness with a smooth mucosal surface.
Poodle X	The right kidney is normal in size (5.08 cm), shape and echogenicity. It has smooth peripheral margination. There is a normal 1:3 cortex to medulla ratio with appropriate corticomedullary distinction. There is no evidence of pyelectasia, mineral or infarcts observed.
SEX	The left kidney is normal in size (5.87 cm), shape and echogenicity. It has smooth peripheral margination. There is a normal 1:3 cortex to medulla ratio with appropriate corticomedullary distinction. There is no evidence of pyelectasia, mineral or infarcts observed.
Spayed Female	
AGE	Adrenal Glands
11 Months	The area of the right adrenal gland is examined without evident pathology.
WEIGHT	The left adrenal gland is normal in size (2.0 cm long x 0.41 cm at the cranial pole and 0.44 cm at the caudal pole), shape and contour. Corticomedullary structure is unremarkable. Visible surrounding vasculature appears normal.
40 Pounds	Spleen
INTERPRETED BY	The spleen is subjectively normal in size with a normal smooth capsular contour. Parenchyma is appropriately finely textured and homogenous with normal echogenicity relative to surrounding tissue (hyperechoic to liver). No focal nodules or masses are observed. Splenic vasculature appears normal.
Beth Johnson, DVM DACVIM	Liver
IMAGING PERFORMED BY	The liver is subjectively normal in size with normal smooth curvilinear peripheral contour. Parenchyma is appropriately hypoechoic to the spleen in echogenicity and appropriately mildly coarse and homogenous in echotexture. No focal lesions are observed. Visible vasculature and biliary tree appear normal without distension or congestion.
Jenn	The gallbladder is non-distended in size. The wall is smooth without visible thickening. Luminal contents are primarily anechoic. There is no evidence of cystic or common bile duct dilation.
HOSPITAL NAME	Gastrointestinal
Rockaway AH	The stomach wall is normal in thickness (canine < 0.5 cm and feline < 0.4 cm) and layering. The lumen of the stomach is empty with no evidence of obstruction, foreign material or infiltrative disease. Pyloric outflow tract appears patent.
REFERRING VET	The visible small intestines are normal in wall thickness and layering (canine duodenum < 0.5 cm and feline duodenum < 0.4 cm; other < 0.3 cm). Small intestinal motility appears adequate (1-3 contractions per min). The lumen of the small intestine is empty with no evidence of obstruction, foreign material or infiltrative disease.

PATIENT

Bailey Baracaldo

The visible colon is normal in wall thickness (< 0.2 cm) and layering. Contents are consistent with normal formed feces and gas.

Pancreas

SPECIES

Canine

The pancreatic parenchyma is appropriately isoechoic to surrounding tissue. Visible capsule is smooth and normal in contour. There is no visible pancreatic duct dilation. There is no evidence of active peripancreatic inflammation.

BREED

Poodle X

Free Abdomen

There is no evidence of free peritoneal effusion noted in these images.

SEX

Spayed Female

There is no apparent lymphadenopathy noted in these images.

ULTRASONOGRAPHIC FINDINGS

- Unremarkable/normal abdomen without an obvious visible cause for this patient's vomiting in these images.

AGE

11 Months

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

In addition to overall metabolic health screening with a CBC/Chem panel, electrolytes, and urinalysis, additional recommendations include a quantitative PLI or potentially A gastrointestinal malabsorption panel (including cobalamin, folate, TLI and PLI) to Texas A&M GI Laboratory, as well as fecal exam, followed by empirical deworming with a 5-day course of Panacur.

WEIGHT

40 Pounds

Additionally, symptomatic/supportive medical management of possible gastroenteritis with antiemetics, gastroprotectants, and a bland, easy to digest diet is recommended. If clinical signs persist, recheck imaging is recommended.
