

PATIENT	PRESENTING CLINICAL SIGNS
Bentley Borlo	History: severe anus inflammation septic leg with mucoid d/c
SPECIES	ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN
Canine	Urinary System
BREED	Urinary bladder is adequately distended. It has a normal uniform wall thickness. Contents include primarily anechoic fluid with occasional echogenic non-shadowing debris, most consistent with exfoliated cells, mucous and/or small blood clots. Both sterile inflammation as well as urinary tract infection can also present with echogenic debris. No masses or cystoliths are observed. The trigone and visible pelvic urethra are normal in thickness with a smooth mucosal surface.
Golden Retriever	
SEX	The prostate is normal for a neutered dog.
Neutered male	Left kidney is normal is size (6.79 cm), shape and echogenicity. It has smooth peripheral margination. There is a normal 1:3 cortex to medulla ratio with appropriate corticomedullary distinction. There is no evidence of pyelectasia, mineral or infarcts observed.
AGE	Right kidney is normal is size (7.31 cm), shape and echogenicity. It has smooth peripheral margination. There is a normal 1:3 cortex to medulla ratio with appropriate corticomedullary distinction. There is no evidence of pyelectasia, mineral or infarcts observed.
6 years	
WEIGHT	Adrenal Glands
106 lbs	Left adrenal gland is normal in size (2.86 cm long, 0.72 cm at cranial pole and 0.48 cm at caudal pole), shape and overall architecture, echogenicity and echotexture. Visible surrounding vasculature appears normal.
INTERPRETED BY	Caudal pole of the right adrenal gland is visualized and measures 0.6 cm. The remainder of the area is examined without evidence of pathology.
Beth Johnson, DVM DACVIM	
IMAGING PERFORMED BY	Spleen
Jenn	Spleen is subjectively normal in size with a normal smooth capsular contour. Parenchyma is appropriately finely textured and homogenous with normal echogenicity relative to surrounding tissue (hyperechoic to liver). No focal nodules or masses are observed. Splenic vasculature appears normal.
HOSPITAL NAME	
Rockaway AH	
REFERRING VET	Liver
Dr. Maniar	Liver is subjectively normal in size with normal smooth curvilinear peripheral contour. Parenchyma is appropriately hypoechoic to the spleen in echogenicity and appropriately mildly coarse and homogenous in echotexture. No focal lesions are observed. Visible vasculature and biliary tree appear normal without distension or congestion.
INVOICE	Gallbladder
31282	Gallbladder is non-distended in size. The wall is smooth without visible thickening. Luminal contents are primarily anechoic. There is no evidence of cystic or common bile duct dilation.
DATE

PATIENT

Gastrointestinal

Bentley Borlo

The visible stomach wall is normal in thickness and layering. The lumen of the stomach is empty with no evidence of obstruction, foreign material or infiltrative disease. Pyloric outflow tract appears patent.

SPECIES

Canine

The visible small intestines are normal in wall thickness and layering. Small intestinal motility appears adequate (1-3 contractions per min). The lumen of the small intestine is with no evidence of obstruction, foreign material or infiltrative disease.

BREED

Golden Retriever

The visible colon is normal in wall thickness (< 0.2 cm) and layering. Contents are consistent with normal formed feces and gas.

SEX

Neutered male

Pancreas

The observed pancreas appears appropriately isoechoic to surrounding omental fat. Visible capsule is smooth and normal in contour. Visible pancreatic parenchyma is homogenous and unremarkable. There is no visible pancreatic duct dilation. There is no evidence of active peripancreatic inflammation.

AGE

6 years

Free Abdomen

There is no evidence of peritoneal effusion or apparent lymphadenopathy noted in these images.

WEIGHT

106 lbs

ULTRASONOGRAPHIC FINDINGS

INTERPRETED BY

Beth Johnson, DVM
DACVIM

Primary Findings

Urinary bladder debris.

Otherwise, unremarkable abdomen without visible cause for the peri-anal inflammation and sepsis reported in the leg.

IMAGING PERFORMED BY

Jenn

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Urinalysis and, if indicated based on urinalysis results, urine culture are recommended. If protein is present in an otherwise quiet sediment, protein quantification with a urine protein to creatinine ration is recommended.

HOSPITAL NAME

Rockaway AH

Rectal exam for anal gland pathology if not already evaluated +/- an aspirate of the leg for cytology and culture as well as potentially advanced imaging of the area for example a CT scan can be considered.

REFERRING VET

Dr. Maniar

Comprehensive infectious disease testing may be warranted too.
