

| | |
|-----------------------------|--|
| PATIENT | PRESENTING CLINICAL SIGNS |
| Myles Buonocore | History: recheck prev u/s on 6/22 |
| SPECIES | ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN |
| Feline | Urinary System |
| BREED | Urinary bladder is adequately distended with anechoic contents. No masses, inflammatory changes, echogenic sediment or cystoliths are observed. The urinary bladder, trigone and visible pelvic urethra are normal in thickness with a smooth mucosal surface. |
| Domestic Shorthair | Kidneys are bilaterally small (or normal in size – I'll describe individually), irregular and diffusely echogenic with decreased corticomedullary distinction and poor visualization of internal architecture. There is no pyelectasia noted and no mineral is observed. The left kidney measured 3.97 cm. The right adrenal gland measured 4.48 cm. |
| SEX | |
| Neutered male | |
| AGE | Adrenal Glands |
| 10 years | Left adrenal gland is normal in size (0.32 cm), shape and overall architecture, echogenicity and echotexture. Visible surrounding vasculature appears normal. |
| WEIGHT | Right adrenal gland is unable to be visualized. |
| 16.8 lbs | |
| INTERPRETED BY | Spleen |
| Beth Johnson, DVM DACVIM | Spleen is subjectively normal in size with a normal smooth capsular contour. Parenchyma is appropriately finely textured and homogenous with normal echogenicity relative to surrounding tissue (hyperechoic to liver). No focal nodules or masses are observed. Splenic vasculature appears normal. |
| IMAGING PERFORMED BY | Liver |
| Jenn | Liver is subjectively normal in size with normal smooth curvilinear peripheral contour. Parenchyma is appropriately hypoechoic to the spleen in echogenicity and appropriately mildly coarse and homogenous in echotexture. No focal lesions are observed. Visible vasculature and biliary tree appear normal without distension or congestion. |
| HOSPITAL NAME | Gallbladder is non-distended in size. The wall is smooth without visible thickening. Luminal contents are primarily anechoic. There is no evidence of cystic or common bile duct dilation. |
| Rockaway AH | |
| REFERRING VET | Gastrointestinal |
| Dr. Maniar | The visible stomach wall is normal in thickness and layering. The lumen of the stomach is empty with no evidence of obstruction, foreign material or infiltrative disease. Pyloric outflow tract appears patent. |
| INVOICE | The visible small intestines are normal in wall thickness and layering. Small intestinal motility appears adequate (1-3 contractions per min). The lumen of the small intestine is empty with no evidence of obstruction, foreign material or infiltrative disease. |

| DATE | |
| 6/28/22 | |

PATIENT

The visible colon is normal in wall thickness (< 0.2 cm) and layering. Contents are consistent with normal formed feces and gas.

Myles Buonocore

SPECIES

Pancreas

Feline

The observed pancreas appears appropriately isoechoic to surrounding omental fat. Visible capsule is smooth and normal in contour. Visible pancreatic parenchyma is homogenous and unremarkable. There is no visible pancreatic duct dilation. There is no evidence of active peripancreatic inflammation.

BREED

Domestic Shorthair

Free Abdomen

SEX

There is no evidence of peritoneal effusion or apparent lymphadenopathy noted in these images.

Neutered male

ULTRASONOGRAPHIC FINDINGS

AGE

Chronic Kidney Disease – This appearance of the kidneys is consistent with chronic kidney disease such as chronic glomerular or interstitial nephritis, chronic pyelonephritis, etc.

10 years

WEIGHT

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

16.8 lbs

This patient's original presenting history was suspect chronic foreign body. There was no evidence of foreign material or obstructive pattern in these images; however, if GI signs are present and chronic, then recommendations include:

INTERPRETED BY

A gastrointestinal malabsorption panel (including cobalamin, folate, TLI and PLI) to Texas A&M GI Laboratory is recommended for further evaluation of GI and pancreatic function.
