

<b>PATIENT</b>	<b>PRESENTING CLINICAL SIGNS</b>
Mia Johnston	Preventative Care Scan- P will be examined tomorrow prior to your arrival
<b>SPECIES</b>	Abnormal PE/Chem/CBC/UA Results: 7/24/23-T4 above normal limits at 6.7 ug/dL; BUN, Amylase and mildly elevated PSL of questionable significance without clinical signs of GI upset (will be further evaluated during ultrasound); reviewed symptoms of hyperthyroidism- owner elected to start with methimazole trial Current Medications Will discuss tomorrow Radiographic Findings To be completed tomorrow
Feline	
<b>BREED</b>	
Blue Point	<b>ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN</b>
<b>SEX</b>	<b>Urinary System</b>
Spayed Female	The urinary bladder is moderately distended with anechoic contents. No masses, inflammatory changes, echogenic sediment or cystoliths are observed. The urinary bladder, trigone and visible pelvic urethra are normal in thickness with a smooth mucosal surface.
<b>AGE</b>	The right kidney is normal in size (3.97 cm), shape and echogenicity. It has smooth peripheral margination. There is a normal 1:3 cortex to medulla ratio with appropriate corticomedullary distinction. There is no evidence of pyelectasia, mineral or infarcts observed.
16 Years	The left kidney is normal in size (3.44 cm), shape and echogenicity. It has smooth peripheral margination. There is a normal 1:3 cortex to medulla ratio with appropriate corticomedullary distinction. There is no evidence of pyelectasia, mineral or infarcts observed.
<b>WEIGHT</b>	
8.13 Pounds	
<b>INTERPRETED BY</b>	<b>Adrenal Glands</b>
Beth Johnson, DVM DACVIM	The right adrenal gland is normal in size (0.44 cm), shape and contour. Corticomedullary structure is unremarkable. Visible surrounding vasculature appears normal.
<b>IMAGING PERFORMED BY</b>	The left adrenal gland is normal in size (0.45 cm), shape and contour. Corticomedullary structure is unremarkable. Visible surrounding vasculature appears normal.
Sara Hansen	<b>Spleen</b>
<b>HOSPITAL NAME</b>	The spleen is subjectively normal in size with a normal smooth capsular contour. Parenchyma is appropriately finely textured and homogenous with normal echogenicity relative to surrounding tissue (hyperechoic to liver). No focal nodules or masses are observed. Splenic vasculature appears normal.
VCA Salem AH	<b>Liver</b>
<b>REFERRING VET</b>	The liver is subjectively normal in size with normal smooth curvilinear peripheral contour. Parenchyma is appropriately hypoechoic to the spleen in echogenicity and appropriately mildly coarse and homogenous in echotexture. No focal lesions are observed. Visible vasculature and biliary tree appear normal without distension or congestion.
Dr. Walling	
<b>INVOICE</b>	The gallbladder is non-distended in size. The wall is smooth without visible thickening. Luminal contents are primarily anechoic. There is no evidence of cystic or common bile duct dilation.

**PATIENT** *Gastrointestinal*

Mia Johnston The stomach wall is normal in thickness (canine < 0.5 cm and feline < 0.4 cm) and layering. The lumen of the stomach is empty with no evidence of obstruction, foreign material or infiltrative disease. Pyloric outflow tract appears patent.

**SPECIES**

Feline

The visible small intestines are normal in wall thickness and layering (canine duodenum < 0.5 cm and feline duodenum < 0.4 cm; other < 0.3 cm). Small intestinal motility appears adequate (1-3 contractions per min). The lumen of the small intestine is empty with no evidence of obstruction, foreign material or infiltrative disease.

**BREED**

Blue Point

**SEX**

Spayed Female

The visible colon is normal in wall thickness (< 0.2 cm) and layering. Contents are consistent with normal formed feces and gas.

**AGE**

16 Years

*Pancreas*

The observed pancreas appears appropriately isoechoic to surrounding omental fat. The capsule is mildly irregular in shape. Parenchyma is mildly heterogenous and coarse. There is no visible pancreatic duct dilation. There is no evidence of active peripancreatic inflammation.

**WEIGHT**

8.13 Pounds

*Free Abdomen*

There is no evidence of free peritoneal effusion noted in these images.

**INTERPRETED BY**

Beth Johnson, DVM  
DACVIM

The mesenteric lymph nodes are prominent in size with swollen capsular contour. Normal elongated shape (length to width ratio) is maintained. There is no loss of parenchymal detail.

**ULTRASONOGRAPHIC FINDINGS**

- **Pancreatic age-related remodeling** – Mild irregularities are consistent with benign age-related change. Low-grade smoldering chronic pancreatitis cannot be ruled out and should be suspected in the face of appropriate clinical signs.
- **Reactive mesenteric lymph nodes** – infiltrative neoplastic disease cannot be ruled out but is considered less likely.

**IMAGING PERFORMED BY**

Sara Hansen

**HOSPITAL NAME**

VCA Salem AH

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Medical management of this patient's reported recent diagnosis of hyperthyroidism is recommended at this time with further evaluation pending clinical response, etc.

**REFERRING VET**

Dr. Walling

Emerging infiltrative bowel disease could be present/possible, given the lymphadenopathy. However, without clinical signs such as weight loss, vomiting, diarrhea, etc., monitoring at this time is appropriate.
