

**PATIENT**

Molly Duggan

**SPECIES**

Feline

**BREED**

DSH

**SEX**

Spayed Female

**AGE**

16 Years

**WEIGHT**

5.28 kg

**INTERPRETED BY**

Dr Brittany Sinclair,  
BVSc(hons),  
DACVECC

**IMAGING PERFORMED BY**

Kelly Reschny

**HOSPITAL NAME**

East Credit Veterinary  
Hospital

**REFERRING VET**

Dr. Webster

**INVOICE**

72188

**DATE**

1/13/26

**PRESENTING CLINICAL SIGNS**

2 month follow up from October 2025 Cystic liver mass Current Medications Hypoallergenic diet (Hills z/d canned and dry), Gabapentin 25 mg PO BID, Denamarin SID

Abnormal PE/Chem/CBC/UA Results: Chest radiographs taken in Oct. 2025 looking for metastatic changes (none seen) rads, BW and prev US attached

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

The urinary bladder, trigone, and visible pelvic urethra were of normal thickness. The ureters were not visible which is normal. There was normal wall layering with no masses, uroliths or abnormal thickening visualized. Urine was anechoic. No evidence of inflammatory or neoplastic changes were noted.

The kidneys have a smooth capsule and with hazing of corticomedullary definition to the point of inability to determine cortical/medullary ratio. No evidence of pelvic dilation was present. Left kidney measures 4.04 cm. Right kidney measures 4.53 cm.

**Adrenal Glands**

Adrenal glands are visualized and measured on still images only. Resolution is inadequate to assess glandular detail or confirm measurement. Left measures 0.36 cm in thickness. Right measures 0.36 cm in thickness.

**Spleen**

The spleen is minimally visualized. The portion of spleen visible is normal.

**Liver**

The liver contains a very large, cavitated/cystic mass extending from the left liver across midline to the right liver. It measures at least 6.4 cm x 7.5 cm, though true measurement is difficult to obtain, as the mass is too large to fit in one still image. It appears essentially static from previous examination.

Gall bladder is moderately distended with normal wall thickness and anechoic contents. Common bile duct is non-distended and tapers normally.

**Gastrointestinal**

The stomach contains minimal luminal contents. It measures at a normal thickness of with some variability due to the presence of rugal folds. The distinction of the gastric wall layers is adequate. No masses or focal lesions were observed.

The visualized areas of duodenum, jejunum and ileum have a relatively uniform diameter with minimal fluid distension. Wall thickness is diffusely increased and wall layering is distinct with a prominent muscularis layer. There were no focal lesions consistent with obstruction or a mass effect observed.

Sections of colon are visualized with formed fecal material and gas shadowing distally. There is no observed focal or generalized colon wall thickening or loss of layering.

**PATIENT**

**Pancreas**

Molly Duggan

The area of the pancreas was isoechoic to surrounding tissue with no overt inflammation. Pancreatic tissue was not distinctly visualized which is common.

**SPECIES**

**Free Abdomen**

Feline

No clinically significant lymphadenopathy or abnormalities noted. No free fluid noted.

**BREED**

**ULTRASONOGRAPHIC FINDINGS**

DSH

- Static large, cavitated liver mass.
- Static thickened small intestine with prominent muscularis.
- Static age related renal changes.

**SEX**

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Spayed Female

Previously noted abdominal abnormalities are still present and appear static.

**AGE**

16 Years

**WEIGHT**

5.28 kg
