

**PATIENT**

Theo Kordestani

**SPECIES**

Canine

**BREED**

Poodle x

**SEX**

Neutered Male

**AGE**

7 Years

**WEIGHT**

19.7 kg

**INTERPRETED BY**

Dr Brittany Sinclair,  
 BVSc(hons),  
 DACVECC

**IMAGING PERFORMED BY**

Amanda Stewart

**HOSPITAL NAME**

Buck Animal Hospital

**REFERRING VET**

Dr. Armstrong

**INVOICE**

73554

**DATE**

3/11/26

**PRESENTING CLINICAL SIGNS**

Vomited 5 days after vaccine for 2 days. Stools normal but maybe mucousy. Eating well, almost back to normal, some retching. Reason for vomiting?

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

**Urinary System**

Urinary bladder lumen volume is small, and walls are diffusely thickened most consistent with pseudohypertrophy. The ureters were not visible which is normal. There was normal wall layering with no masses, uroliths or abnormal focal thickening visualized. Urine was anechoic. No evidence of inflammatory or neoplastic changes were noted.

The kidneys were both normal size and structure, with smooth capsule and normal corticomedullary definition and ratio. Medullary structure differed distinctly from that of the cortex. No evidence of pelvic dilation was present. Left kidney measures 6.09 cm. Right kidney measured 6.04 cm.

**Adrenal Glands**

Both adrenal glands were visualized and recognized as having normal shape, size, position and echogenicity for this breed and age. The visible phrenic vasculature was unremarkable. Left measures 2.28 cm in length x 0.41 cm at the caudal pole and 0.44 cm at the cranial pole. Right measures 1.88 cm in length x 0.72 cm in thickness.

**Spleen**

The spleen was normal with age appropriate homogeneous parenchyma and a smooth capsule with normal splenic vasculature with no signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarct changes were noted.

**Liver**

The liver is subjectively normal in size with normal contours and structure. There is age appropriate echogenicity and echotexture. No overt structural evidence of inflammatory, infiltrative or regenerative pathology is evident. Vascular and biliary tracts are of normal volume with no evidence of congestion. *\*Visualization of the liver was somewhat hindered by gastric distention and apparent heavy panting.*

Gall bladder is moderately distended with normal wall thickness and anechoic contents. Common bile duct is non-distended and tapers normally.

**Gastrointestinal**

The stomach is severely distended with echogenic non-shadowing fluid with thinning of the gastric wall. The proximal duodenum and other sections of small intestine are also dilated with similar appearing fluid and back and forth fluid motion. There is shadowing material within the GI tract. Exact location cannot be determined.

The ileocecal junction was not distinctly visualized. Sections of colon are visualized with gas shadowing. There is no observed focal or generalized colon wall thickening or loss of layering.

**Pancreas**

The visible pancreas was observed to be largely isoechoic to surrounding omental fat.

**PATIENT**

Theo Kordestani

**Free Abdomen**

No clinically significant lymphadenopathy or abnormalities noted. No free fluid noted.

**SPECIES**

Canine

**ULTRASONOGRAPHIC FINDINGS**

- Severe gastric distention with fluid, small intestinal distention with fluid, with shadowing material – concern for obstructive foreign body.

**BREED**

Poodle x

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

The combination of gastric distention together with segmental small intestinal distention as well as shadowing material and clinical signs is most concerning for obstructive foreign body. Abdominal explore should be strongly considered.

**SEX**

Neutered Male
