

PATIENT

Ollie Librizzi

PRESENTING CLINICAL SIGNS

Decreased appetite. weight loss. Low PCV.
Abnormal PE/Chem/CBC/UA Results: Blood TP 11.8, GLOB 8.9, PCV 13%,

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The pelvic urethra was imaged 2.0 cm beyond the cystourethral junction. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

BREED

Domestic Shorthair

SEX

Neutered male

The **kidneys** are slightly enlarged with minor loss of corticomedullary definition. The right kidney measured 4.17 cm. The left kidney measured 3.94 cm.

AGE

1 ½ years

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

WEIGHT

9 lbs

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

Spleen

The **spleen** is enlarged and irregular in contour. The spleen measured up to 1.5 cm. Ultrasound-guided FNA is warranted.

IMAGING PERFORMED BY

JK

Liver

The **liver** is mildly enlarged, yet uniform. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident.

Hamburg VC

REFERRING VET

Dr. DenHeyer

Gastrointestinal

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

PATIENT

Pancreas

Ollie Librizzi

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

Feline

ULTRASONOGRAPHIC FINDINGS

BREED

Splenomegaly.

Domestic Shorthair

Slightly enlarged kidneys with loss of corticomedullary definition.

SEX

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Neutered male

FNA of the spleen is indicated after blood transfusion given the low PCV. Round cell neoplasia, splenitis, hyperplasia are all possible. Bone marrow aspirate is also indicated depending on CBC path review.

AGE

1 ½ years

WEIGHT
