## PRESENTING CLINICAL SIGNS

Splenectomy 1 month ago- hemangiosarcoma. At that time did not appear there was spread to other organs per doc that did the surgery. Did well post op but last 24 hours or so pet has been shaking, gums appear pale.

Abnormal PE/Chem/CBC/UA Results: CBC/Chem 1 mo ago- decreased platelets Recheck pending  
Chest rads clear

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. Left measured 5.2 cm. Right kidney measured 5.8 cm.

### Adrenal Glands

The **adrenal glands** were not visualized.

### Spleen

The region of the **splenic fossa** was unremarkable.

### Liver

The cranial **liver** presented multifocal hypoechoic undifferentiated nodular changes measuring up to 1.0 cm. The gallbladder presented some dependent debris with essentially normal contour. The cystic and common bile ducts were normal.

### Gastrointestinal

There was some residual chyme and gas was noted in the **stomach**, yet not pathological. This is consistent with end post prandial presentation. Transit of chyme into the small intestine was normal. Curvilinear patterns were maintained throughout the GI tract. No evidence of pathology. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

### Pancreas

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

## Free Abdomen

The mid cranial abdomen revealed an undifferentiated hypoechoic lymph node cluster in the sublumbar space with hyperechoic surrounding fat measuring 2.7 cm x 1.1 cm. Strong concern for a neoplastic process. FNA indicated.

Rapid view of the heart revealed no gross pathology.

## ULTRASONOGRAPHIC FINDINGS

- Sublumbar lymphadenopathy.
- Concerning hepatic nodules.
- Partially full stomach.

## INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Ultrasound guided FNA of the sublumbar nodules and liver nodules recommended. Chest radiographs warranted if not already performed.

Sound beam attenuation is persistently an issue in this patient regarding diagnostic quality.
