

**PATIENT**

**PRESENTING CLINICAL SIGNS**

Lil'Bit Rotonda

History: vomiting and loss of appetite . weight loss . blood work result is normal . PLI- negative

**SPECIES**

**ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN**

Feline

**Urinary System**

**BREED**

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

Domestic Shorthair

**SEX**

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilatation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 4.04 cm.

Spayed female

**AGE**

11 years

**Adrenal Glands**

**WEIGHT**

9.9 lbs

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient.

**INTERPRETED BY**

**Spleen**

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

The **spleen** was mildly enlarged and measured 1.2 cm in width. The parenchyma was uniform with mild scalloping contour.

**IMAGING PERFORMED BY**

Dr. Han

**Liver**

**HOSPITAL NAME**

Tenafly VC

The **liver** images from right and left intercostal as well as subcostal views revealed subjectively normal liver size, contour, and structure. Some age-related parenchymal remodeling was noted but likely not clinically significant at this time. Vascular and biliary tracts were of normal volume and no evidence of congestion was noted. The gallbladder presented some dependent debris with essentially normal contour. The cystic and common bile ducts were normal. No overt evidence of active inflammatory, infiltrative or regenerative pathology was noted but should be paired with current or past LE elevations regarding any clinical significance to this presentation. The hepatic lymph nodes were unremarkable.

**REFERRING VET**

Dr. Han

**Gastrointestinal**

**INVOICE**

42347

The stomach was empty in this patient. The small intestines and colon were unremarkable. An epigastric or pancreatic lymph node was noted in this patient as well as a 1.0 cm mesenteric lymph node enlargement. Smaller lymph nodes were also present.

**DATE**

1/26/23

**PATIENT**

**Pancreas**

Lil'Bit Rotonda

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

**SPECIES**

Feline

**ULTRASONOGRAPHIC FINDINGS**

**BREED**

Epigastric and mesenteric lymphadenopathy with splenic enlargement.

Domestic Shorthair

Otherwise, unremarkable abdomen.

**SEX**

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

Spayed female

Splenic and hepatic FNA is warranted to assess for round cell neoplasia. Round cell neoplasia versus splenitis versus reactive spleen and lymphadenitis.
