

PATIENT

Milo Becker

PRESENTING CLINICAL SIGNS

vomiting lethargic

SPECIES

Feline

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes were noted. Ureteral papillae were normal.

BREED

DSH

SEX

Neutered Male

The **kidneys** revealed largely normal size and structure, corticomedullary definition and ratio (cortex 1/3 of medulla) were essentially maintained with some age-related loss of curvilinear patterns regarding the capsule and C/M junction. The cortices presented largely uniform texture with some increased echogenicity expected for his age patient. Medullary structure differed distinctly from that of the cortex and no evidence of pelvic dilation was present. Mineralization noted in both kidneys. The right kidney measured 4.46 cm. The left kidney measured 4.1 cm. Minor cortical cysts noted.

AGE

8 Years

Adrenal Glands

The regions of the **adrenal glands** were unremarkable.

WEIGHT

6.6 Pounds

Spleen

The **spleen** in this patient was uniform, yet volume contracted. Hydration status should be assessed.

Liver

The **liver** was diffusely hyperechoic to falciform fat. The gallbladder and common bile duct were unremarkable.

INTERPRETED BY

Eric Lindquist, DMV

Gastrointestinal

The **gastrointestinal tract** revealed minor variable thickening and echogenic submucosal changes most consistent with low grade end result of chronic GI disease such as IBD and may be related to malassimilation of nutrients if any weight loss is present. No obvious neoplastic patterns were noted and luminal content as unremarkable.

DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Jenn

HOSPITAL NAME

Rockaway AH

Pancreas

The **pancreas** was hypoechoic and irregular. Enhanced surrounding mesentery noted, suggestive for pancreatitis.

REFERRING VET

Dr. Maniar

ULTRASONOGRAPHIC FINDINGS

- Pancreatitis pattern
- Lipidosis pattern
- Age related renal changes with cortical cysts

INVOICE

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

Assessment of liver values for potential lipidosis recommended. Supportive care for pancreatitis indicated. Broad-spectrum antibiotics, IV fluid support recommended. If clinical signs persist, then FNA of the pancreas and liver would be ideal after coagulation panel.
