

## PATIENT

Roscoe Solesbee

## SPECIES

Canine

## BREED

Beagle

## SEX

Neutered male

## AGE

6 years

## WEIGHT

35 lbs

## INTERPRETED BY

Eric Lindquist, DMV  
DABVP, Cert. IVUSS

## IMAGING PERFORMED BY

Ashley Whitesell

## HOSPITAL NAME

Dickson AC

## REFERRING VET

Dr. Whitesell

## INVOICE

70990

## DATE

1/27/26

## PRESENTING CLINICAL SIGNS

- Has anal gland adenocarcinoma, just looking for mets
- Mildly elevated ALKP 254

## ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

### *Urinary System*

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities.

The residual **prostate** measured 0.5 cm.

### *Adrenal Glands*

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The right adrenal gland measured 0.6 cm at the caudal pole and 1.0 cm at the cranial pole. The left adrenal gland measured 0.67 cm at the caudal pole and 0.54 cm at the cranial pole.

### *Spleen*

The **spleen** presented a smooth homogeneous parenchyma hyperechoic to liver and renal cortical parenchyma. The capsule was smooth without noticeable expansion or deviation from within the spleen or adjacent pathology. The splenic vasculature demonstrated normal volume without signs of congestion or thrombosis. No sonographic evidence of acute or chronic inflammatory, neoplastic, or infarctual changes was noted.

### *Liver*

The **liver** revealed a hypoechoic nodular change with mildly increased portal markings. The nodule measured 0.7 cm. The gallbladder was unremarkable with a minor amount of coalesced bile.

**PATIENT**

Roscoe Solesbee

**SPECIES**

Canine

**BREED**

Beagle

**SEX**

Neutered male

**AGE**

6 years

**Gastrointestinal**

Examination of the **gastrointestinal tract** revealed a stomach and intestine free of stasis, of normal wall thickness, acceptable curvilinear mural detail, and peristaltic activity. Small and large intestine demonstrated normal luminal chyme and stool consistency respectively. No obstructive or overt infiltrative disease was noted. No associated abnormal lymphatic activity was noted.

**Pancreas**

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Some parenchymal remodeling, however, with mild deviation from curvilinear normalcy was observed. Pancreatic duct and capsular irregularities were present consistent with age related changes. If pain upon imaging (+ Murphy sign) was present or if the patient is focally painful in subxiphoid palpation then low-grade smoldering chronic pancreatitis should be suspected.

**ULTRASONOGRAPHIC FINDINGS**

Age related abdominal changes.

Liver nodule, likely hyperplasia. This would not be a typical place for metastatic disease of this type.

**INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS**

There was no evidence of metastatic disease. The hepatic nodule should be monitored.
