

PATIENT

Skye Angelotto

PRESENTING CLINICAL SIGNS

Recheck 2.0 cm pyloric material and chronic inflammatory hepatopathy, minor hypersplenism

SPECIES

Canine

ULTRASONOGRAPHIC EXAMINATION OF THE ABDOMEN

Urinary System

BREED

Boxer Mix

The **urinary bladder**, trigone, and pelvic urethra presented normal thicknesses and normal tone. The ureters were not visible which is normal. No uroliths or sediment were visualized and anechoic urine was present. No evidence of inflammatory or neoplastic changes was noted. Ureteral papillae were normal.

SEX

Spayed Female

The **kidneys** revealed normal size and structure, corticomedullary definition and ratio for this age. The cortices presented largely uniform texture with normal echogenic relationship to liver and spleen. Medullary structure differed distinctly from the cortex and no evidence of pelvic dilation was present. The capsules were acceptably uniform without significant irregularities. The left kidney measured 5.82 cm.

AGE

6 years

WEIGHT

50 lbs

Adrenal Glands

Both **adrenal glands** were visualized and recognized as having normal shape, size, position and echogenicity for this breed. The phrenic vasculature, glandular echogenicity and detail were unremarkable. Capsule, cortex, and medullary definition were normal for this age patient. The left adrenal gland measured 2.05 x 0.55 cm at the caudal pole and 0.54 cm at the cranial pole. The right adrenal gland measured 2.02 x 0.58 cm at the caudal pole and 0.65 cm at the cranial pole.

INTERPRETED BY

Eric Lindquist, DMV
DABVP, Cert. IVUSS

IMAGING PERFORMED BY

Jenn

Spleen

The **spleen** was slightly swollen and uniform. The vascularity was normal.

HOSPITAL NAME

Rockaway AH

Liver

The **liver** images submitted revealed subjectively normal liver size, contour, and structure. Parenchymal echogenicity was naturally coarse and hypoechoic to the spleen. Vascular and biliary tracts were of normal volume with no evidence of congestion. The gallbladder presented acceptably thin walls with primarily anechoic content. The cystic and common bile ducts were normal. No pathological hepatic lymphadenopathy was evident. No overt structural evidence of inflammatory, infiltrative or regenerative pathology was evident.

Gastrointestinal

DATE

1/4/22

The **pylorus** revealed a 1.5 cm structure with minor stasis. Assuming that no oral medications have been given then foreign matter appears to be persistent. This structure does not appear obstructive at this time.

PATIENT

Skye Angelotto

Pancreas

SPECIES

Canine

The base and limbs of the **pancreas** were observed to be largely isoechoic to surrounding omental fat. Pancreatic duct and capsular contour were acceptably normal and parenchyma respected normal curvilinear patterns. No overt evidence of active inflammatory or neoplastic disease was noted.

BREED

Boxer Mix

ULTRASONOGRAPHIC FINDINGS

1.5-2.0 cm persistent structure in the pyloric outflow, non-obstructive.

Minor persistent hypersplenism.

SEX

Spayed Female

INTERPRETATION OF THE FINDINGS & FURTHER RECOMMENDATIONS

If the patient is non-symptomatic then endoscopy could be considered or induction of vomiting. I recommend obtaining history of oral medication.
